The present paper incorporates a number of redeterminations and additions to the information in the reports of 2007, 2008 and 2009.

### *THE AREA*

An area of rolling Aspen Parkland 3 km south of Nevis, Alberta, was studied repeatedly from 2001 to 2005. It was an acreage owned by Allen and Laura Hall. GPS readings for the area rounded off to 52.31 N and 113.05 W with an elevation of 890 m, though Google Earth readings were 52.186 N, 113.017 W and 812 m. Moths were collected with ultraviolet light traps on 42 different collection nights, details of which appear in the Appendix. The results of this research have not previously been reported. Voucher specimens are in the BIRD Collection.

Map showing the location of Nevis, Erskine, Stettler and Buffalo Lake in south-central Alberta. The present study area and the Buffalo Lake Moraine Conservation Area, which is on the east side of Buffalo Lake, are both examples of native Aspen Parkland.

While the grass in the acreage proper is mowed, natural areas of shrub and bush remain. The traps were in all cases set up on the edge of the property so that they would be able to sample the moths in the adjoining, lightly grazed, native aspen parkland on land owned by the Church family. On the north, there is a south-facing hillside with native grasses and forbs, including a small stand of *Opuntia fragilis*. On the west, there is a low area which holds water in most years. Various of the collected moths are associated with the aquatic and subaquatic plants that are found there. On the south, southwest and northwest, there are stands of aspen. A patch of saskatoon and chokecherry is found in the acreage and near its western side.

The study area was an excellent choice because it had been little disturbed and also because the Halls kindly allowed access. The study ceased when the Hall's sold the acreage in 2006.

## ***BACKGROUND***

The writer, now retired and living in Erskine, Alberta, has had a long-time interest in the natural flora and fauna of the province. In the spring of 2000, he commenced an examination of the moths of south-central Alberta, the purpose of which was to document the species present in various natural areas. This is important as such native areas are rapidly disappearing because of clearing and cultivation and also because of over grazing by livestock. The writer is a member of the Alberta Lepidopterist's Guild, the purpose of which is to encourage the study of Alberta's moths and butterflies.

There is still much to be learned about the distribution and status of lepidopteran (moth and butterfly) species in south-central Alberta. Baseline studies provide information that helps characterize those species associated with various ecoregions, in the present case Aspen Parkland; determine status designations (abundant, common, rare, endangered) of various species; and allow the examination of many other parameters, including phenology, dry vs. wet years, and outbreaks of various species such as forest tent caterpillars.

## ***SPECIMEN DISPOSITION***

All specimens collected by the writer presently reside in his collection but they will eventually be donated to the University of Alberta Strickland Museum, the Northern Forest Research Centre in Edmonton, and, possibly, the Canadian National Collection in Ottawa.

## ***RESULTS***

The order and terminology, is that of R.W. Hodges (1983) except where recent changes in taxonomy have occurred. While most of the larger (macromoths) are relatively well known, the same cannot be said for many of the smaller micromoths. Identifications, especially of the latter, can, at times, be difficult or are at present impossible, until such time as revisionary studies are made. Also, genitalic dissection and examination is necessary for positive identification in some groups. For these reasons, some of the determinations found herein should be regarded as tentative. The scientific names of the species are followed by the day-month-year of the collection and the number of individuals mounted; an “SR” indicates a sight record. Common names are mentioned in those cases where such names exist.

Pohl et al (2010) have put together an up-to-date annotated list of the Lepidoptera of Alberta. They include 2367 species, many more than those mentioned by Bowman (1951). The list incorporates recent changes in taxonomy of all groups according to various literature sources, including those listed for the Noctuoidea by Lafontaine & Schmidt (2010).

## ***DISCUSSION***

An analysis of the data from the present study of the moths encountered in twelve major study areas in south-central Alberta, reveals that the present area (AH) is most similar (57.50%) to the Buffalo Lake Conservation Area (BL), (56.38%) to the semi-urban Erskine site (ER) and (56.34%) to the Big Knife area. It was least similar (27.20%) to that of the Dry Island Area (DI).

## ***SUMMARY***

Four hundred and forty two species of moths were found in the area. The area was sampled with ultraviolet traps on 42 trap nights. To put things into perspective, Pohl et al (2010) document 2367 species of Lepidoptera for Alberta. As this area, though small, is quite typical Aspen Parkland, it is felt that the majority of the species characteristic of this ecological zone are listed.

Of the 14 major areas involved in the present study, five species of moths, *Coleophora kearfotella* B. & Bsk., *Phaneta salmicolorana* (Heinr.), *Phaneta artemisiana* (Wlsm.), *Eupithecia ammonata* McD. and *Mamestra curialis* (Sm.) were found only in this area.

## ***ACKNOWLEDGEMENTS***

Thanks are extended to Gary Anweiler for verifying or identifying the macromoths and to Greg Pohl for help in the identification of a number of micromoths. Chris Schmidt kindly looked at the Arctiids and some of the Geometrids, Jean-François Landry determined the *Coleophora* specimens, Doug Macaulay identified the Pterophorid specimens and George Balogh named the *Eupithecia* specimens. Jason Dombroskie provided help with some of the Tortricidae.

Felix Sperling and Danny Shpeley facilitated the study of specimens in the Bowman Collection of the Strickland Museum at the University of Alberta, and Greg Pohl did the same for the Northern Forest Research Centre Entomology Collection. Ernest Mengersen is thanked for allowing access to the Entomology Collection at Olds College.

No outside funding was sought, or received, for this study.
