

**Survey of Lepidoptera in the Canadian Shield Ecoregion of
northeastern Alberta**

III. 2002 Survey of Colin-Cornwall Lakes Wildland Park

prepared for the Alberta Natural Heritage Information Centre,
Parks and Protected Areas Division,
Alberta Community Development

by D. Macaulay and G. Pohl,
Alberta Lepidopterists' Guild

April 16, 2002

ERRATA

While curating the specimens listed in this report prior to incorporating them into the Strickland Museum collection and database at the University of Alberta, the following errors were noted and corrected. The species mentioned below are highlighted in yellow in Appendix 1 and 2 of this report.

Geometridae

Selenia alciphearia. Single specimens of *Selenia* collected at Colin Lake on June 6 and 7 and reported as *Selenia kentaria* have been dissected and re-identified as the very similar *Selenia alciphearia*. *S. alciphearia* is a common widespread species in Alberta while *S. kentaria* is much less common and appears to be restricted to settled areas along the southern edge of the boreal forest.

Noctuidae

Papestra quadrata. Three moths collected at Colin Lake on June 8th (1 specimen) and June 12th (2 specimens) and identified as *Trichordestra liquida* have been re-identified as *Papestra quadrata*. Both species are common, widespread species.

Coranarta macrostigma. A specimen of *Coranarta* taken at Colin Lake on June 6th has been dissected and identified as a female of the much rarer *Coranarta macrostigma*. The other specimens of *Coranarta* collected at Colin Lake are correctly identified as *C. luteola*. *C. macrostigma* has been reported from a number of sites in the mountains and foothills of southern Alberta, and in dunes east of Edgerton. It is also known to occur in the western arctic/subarctic, east to Great Bear Lake. [Note: until recently, the genus was *Anarta*, not *Coranarta*].

Orthodes goodelli. A single specimen of *Orthodes goodelli* collected at Colin Lake on July 7th has been dissected and re-identified as *Polia detracta*. Both are widespread species in Alberta.

Gary Anweiler

Introduction

In Alberta, the Canadian Shield Ecoregion is restricted to the extreme northeast part of the province (Beckingham and Archibald 1996; Strong and Leggat 1992). It is subdivided into the Kazan Upland Subregion and the Athabasca Plain Subregion, located to the north and to the south of Lake Athabasca, respectively. There are several wildland parks that have recently been established in these two subregions.

A Lepidoptera survey was conducted in the summer of 2000 (Schmidt and Pohl 2000) in the Maybelle River, Marguerite River and Richardson River Dunes Wildland Parks, which are located in the Athabasca Plain Subregion. In the summer of 2001, two wildland parks located in the Kazan Upland Subregion were surveyed (Macaulay and Pohl 2002), namely La Butte Creek and Fidler-Greywillow. These surveys were the first for all of these parks.

Colin-Cornwall Wildland Park, within the Kazan Upland Subregion, was the focus of a Lepidoptera survey in the summer of 2002. Colin-Cornwall is located about 35 km north of Lake Athabasca near the Alberta-Saskatchewan border. The subregion in which this wildland park is located contains extensive riparian, lakeshore and shield outcrop habitats. The purpose of the survey was to provide an annotated summary of some of the Lepidoptera species that occur in the park, including notes on such parameters as relative abundance, distribution patterns, range extensions and any other relevant biological or behavioral information. The information obtained contributes towards an increased understanding of the Lepidoptera fauna found within this wildland park but also within the broader context of Alberta.

Materials and Methods

The Lepidoptera survey was conducted within Colin-Cornwall Wildland Park from June 6 to 14, and July 6 to 10, 2002. The June survey was conducted by Douglas Macaulay, Ted Johnson and Wayne Nordstrom. Lorna Ash, Duncan Hilchie, Gerald Hilchie, Terri MacKinnon and Wayne Nordstrom conducted the July survey.

Specimens were collected via hand netting during daylight hours and at dusk. At night, specimens were collected at a sheet illuminated by a 175-Watt mercury vapour light powered by a portable generator, and in four 25-Watt 12V DC battery powered ultraviolet light traps. Attempts were made to sample as many habitats as possible. Exact coordinates of collection sites are listed in Table 1.

Table 1: Habitats and locations of collection sites.

Site No.	Habitat	Location	Coordinates
Colin-Cornwall Wildland Park:			
1	BS	Colin Lake E, sand beach	59.58° N 110.06° W
2	OF	Colin Lake SE, open forest	59.53245° N 110.02230° W

19	SB	Woodman Lake, bog at point	59.55039° N 110.48713° W
20	RF	Woodman lake nr outlet, stream hill	59.55434° N 110.47104° W
21	RF	Woodman Creek, riparian area	59.54502° N 110.38846° W

Specimens were identified by the authors using Covell (1984), Handfield (1999), Rockburn and Lafontaine (1976), McGuffin (1977), Lafontaine and Poole (1991), Lafontaine (1998), Schmidt (2000) and a variety of pertinent taxonomic publications, as well as reference collections possessed by the Canadian Forest Service's Northern Forestry Centre, University of Alberta's Strickland Museum and members of the Alberta Lepidopterists' Guild. Higher classification follows Kristensen (1999) and nomenclature follows Poole (1996), except where noted. Voucher specimens have been deposited at the Northern Forestry Centre and the Strickland Museum.

Results

A total of 437 Lepidoptera specimens, belonging to 21 families and 138 species, were collected. Of these, 20 species were butterflies, 66 were macro-moths and 52 were micro-moths. Eleven species are considered to be uncommon. A species list and collection summary appears in Appendix 1; full collection data appears in Appendix 2.

Many more specimens and species were collected in the 2001 La Butte / Fidler Greywillow survey than in the present survey (Table 2). Of the 303 different species collected in the two surveys combined, only 63 species (20.8%) were shared between them. A large proportion (54%) collected in the 2001 La Butte Creek / Fidler Greywillow survey were not collected at Colin-Cornwall, while only 25% of species collected in Colin-Cornwall were not collected in the 2001 survey.

Table 2. Abundance and Diversity of the 2001 and 2002 Wildland Park samples.

Survey	No. Specimens	No. Species	No. Unique to Park
2001- La Butte / Fidler- Greywillow	542	228	165
2002 - Colin-Cornwall	437	138	75

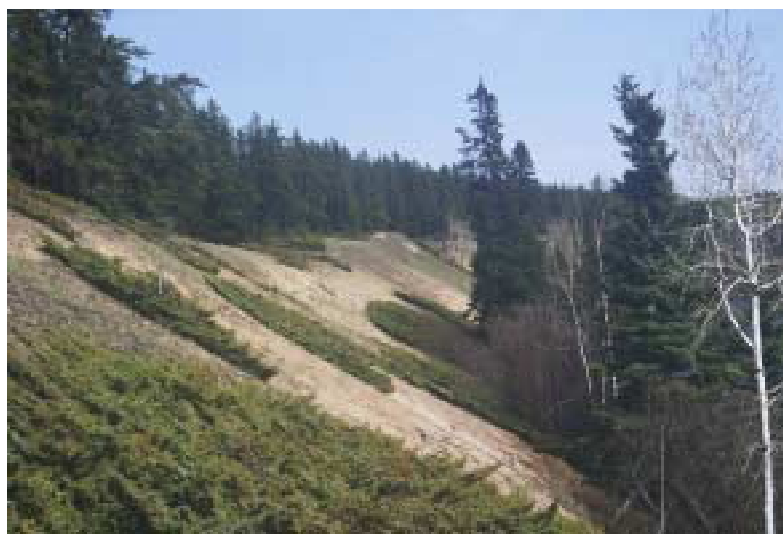

Figure 2. South-facing slope of the sand esker located on the north shore of Esker Lake (Site 12).

Discussion

I. Factors affecting the Survey

Although 138 species were collected in this survey, it represents only a small portion of the 1311 species expected to occur in the region. Many Lepidoptera species are active as adults for a short portion of the season. Thus a complete survey of adult Lepidoptera would require regular collecting (approximately every 10 to 14 days) through the entire flight season, from the end of April until late September. As well, Lepidoptera species are often localized in particular microhabitats, some of which were not accessible on this survey. Despite these limitations, a large number of specimens and species were collected in the survey.

II. Comparison to the 2001 Survey

The parks surveyed in 2001 are in the same ecological subregion as Colin Cornwall Park, and the survey dates were very similar. However, fewer specimens and species were collected in the Colin Cornwall survey than in the La Butte Creek/Fidler-Greywillow survey (Table 2). This is likely due to a combination of factors including weather and environmental conditions, sampling differences, and habitat differences.

The weather in both June and July of 2002 may have led to the reduced species counts. The June survey at Colin-Cornwall was affected by a late spring. Rafts of crumbling ice were still present on Colin Lake on June 9th. About two or three days later, however, most of the ice had melted while the weather remained cool. Thus the peak spring emergence of Lepidoptera occurred after the end of the June survey. In comparison, the region experienced considerably warmer temperatures and relatively normal weather in 2001, which resulted in the collection of many more species of lepidoptera then.

In July 2002, the hot and dry weather conditions throughout the shield area in northeast Alberta led to numerous forest fires. For safety reasons, the base camp was evacuated on July 10th. This reduced the collecting period for lepidoptera by about 10 days, a factor that likely contributed to a lower species count than in 2001.

Given the large size of Colin-Cornwall Wildland Park, collection efforts for lepidoptera were concentrated on those habitats that were accessible. These habitats primarily included: lake shorelines, backshore forests, backshore shrublands, rock outcrops, and the 'sand esker' (Figure 2) on the north shore of 'Esler Lake'. A wider diversity of habitats were studied while at La Butte Creek/Fidler-Greywillow Wildland Parks, including: riparian areas (both river and stream), marshes, upland forests, meadows and beaver ponds. A greater sampling effort in habitats other than lakeshore or near lakeshore at Colin-Cornwall would likely add to the species complement for this park. This is because its lakeshore habitats probably harbor fewer species than its forest, interior wetland and other habitats.

There was very little overlap (20.8%) in species collected on the 2001 and 2002 surveys. This is partly due to the weather and sampling differences discussed above. However, it also indicates

that there is an incredible diversity of habitat types across the Kazan Upland subregion, and that there is little duplication of habitats among these parks.

III. Species Richness

Although this survey collected a large number of Lepidoptera species, many more undoubtedly occur in the area. The butterfly fauna of the Kazan Uplands is fairly well known. The distribution records in Layberry et al. (1998) indicate that 59 species are known or expected to occur in the region. However, the moth fauna is almost completely unknown. Most previous moth records were gathered by the Forest Insect and Disease Survey of the Canadian Forest Service, which surveyed forest pests along the Slave River and in the vicinity of Fort Smith (McGugan 1958, Prentice 1962, 1963, 1965). The total number of Lepidoptera species expected to occur in the Kazan Uplands was extrapolated from the butterfly fauna, using the proportions of butterflies, macro-moths, and micro-moths expected to occur in a northern temperate region (Varis et al. 1987); Table 3. Overall, the survey collected approximately 10.5% of the Lepidoptera expected to occur in the region. Butterflies were more completely sampled than the moths, due to the fact that they are conspicuous and highly mobile. The micro-moths were the least thoroughly sampled, due to their inconspicuous nature and close habitat associations.

Table 3: Diversity of sampled Lepidoptera, and total expected diversity of the Kazan Upland subregion. Expected proportions of species are from Varis et al. (1987); expected number of butterfly species is based on Layberry et al. (1998) and Bird et al. (1995). Other values are extrapolated.

Taxonomic group	No. Spp. collected	Expected % of all Lepidoptera spp.	Expected No. spp.	% collected
Butterflies	20	4.5	59	33.9
Macro-moths	66	35.5	465	14.2
Micro-moths	52	60	787	6.6
Total	138	100	1311	10.5

IV. Distribution patterns and taxa of particular interest

The majority of the species collected in the survey are typical boreal species occurring across northern North America. However, some elements of other faunas were collected as well, including some from the mountainous regions of Alberta, and others more commonly collected in the grasslands. Many records provided substantial range extensions (>500 km), providing valuable information for a region that has had limited Lepidoptera sampling in the past.

The following section contains details of notable range extensions or other significant records, including locality and habitat information from the present survey, and relevant biological or behavioral information from published sources, where available. As well, we have included an indication of the species' general abundance in Alberta, as "abundant", "common", "uncommon", or "rare". Because many of these species are known from fewer than 20 records in Alberta, these categories are based on the authors' experience rather than exact counts of observations or collection specimens. The list is broken down into three parts; butterflies, macro-moths, and micro-moths.

Figure 3. Rock outcrop at Woodman Lake.

A. Butterflies:

Range and biological information is from Bird et al. (1995) and Layberry et al. (1998).

PAPILIONIDAE

Papilio machaon hudsonianus - An uncommon species that exists in localized populations across the boreal forest. This specimen was found patrolling the sand esker 500 m northwest of camp (Site 12). This is the most northern record for Alberta though it exists in the NWT and Yukon.

Figure 4. *P. machaon* sitting on *Ledum groenlandicum* near the basecamp (Site 8).

LYCAENIDAE

Agriades glandon lacustris- A common subspecies that is restricted to rock outcrops of the Canadian Shield. This species is only found in the Kazan Uplands and in the Fort Vermillion regions of Alberta.

Figure 5. *A. glandon lacustris* sitting on *Vaccinium vitis-idaea* near the basecamp (Site 8).

NYMPHALIDAE

Limnitis archippus - An uncommon species occurring in northern Canada. The specimen taken at Colin-Cornwall is near the northern limits of its range; only three more northerly records exist, at La Butte Creek Wildland Park, Ft. Smith and Hay River, NWT.

Boloria eunomia dawsoni – A common species found in across Canada. Subspecies *dawsoni* may not be the correct name for the Canadian Shield specimens. They tend to be darker from other Alberta subspecies (Bird et al. 1995) and with further study these populations may be renamed.

SATYRIDAE

Oeneis chryxus caryi - An uncommon subspecies occurring in the boreal forests of Canada. This is the most northern record for Alberta though it exists in the NWT and Yukon. One specimen was observed on the sand esker located on the north shore of esker lake (Site 13).

B. Macro-moths:

Range and biological information is from Bowman (1951), McGugan (1958), Prentice (1962, 1963), and Tuskes et al. (1996) except as noted.

GEOMETRIDAE

Nemoria rubrifrontaria - This species represents a new record for Alberta, and is a significant range extension. The species has not been recorded between Alberta and northern Ontario/Michigan. In eastern North America, this is a relatively widespread species of boreal bogs and heath barrens where *Myrica* grows.

SATURNIIDAE

Hyalophora gloveri - This is an uncommon species that occurs across the boreal forest. This is the most northern record for the province though it has been found near Zama City and into southern NWT. A cocoon was found on *Sheperdia canadensis* on a sand esker 4 km west of basecamp (site 13).

NOTODONTIDAE

Clostera brucei - This is an uncommon species that occurs across the boreal forest. This record is a substantial range extension; published records report it only as far North as the southern boreal forest, although it has been taken recently in Zama City.

NOCTUIDAE (sensu Poole 1996)

Range and biological information is from Bowman (1951) and McGugan (1958), except as noted.

Lomanaltes eductalis - This is an uncommon species that exists across the boreal forest. Although no published records report it north of the southern boreal, it has been taken recently at Zama City.

Drasteria hudsonica - This uncommon northern species occurs in the boreal forest and grasslands of Alberta. The only other boreal forest locality is south of Athabasca Dunes Wildland Park, where it was collected on the Shield Survey in 2000. In Colin-Cornwall, large numbers of this species were observed on the sand eskers located on the north shore of Esker Lake.

Sideridis maryx - This is an uncommon species that occurs across the boreal forest. This record is a substantial range extension from the southern boreal.

Anarta luteola - A common species that occurs across the boreal forest. This record is a substantial range extension, having only been found in the southern boreal until now. Specimens were collected nectaring at *Chamaedaphne calyculata* and *Arctostaphylos uva-ursi* in large numbers.

Figure 6. *A. luteola* nectaring on *Chamaedaphne calyculata* (Site 9).

Heliothis borealis - This is an uncommon species that occurs across the boreal forest. This record is a substantial range extension from the southern boreal. Specimens were collected nectaring at *Arctostaphylos uva-ursi*.

C. Micro-moths:

Range and biological information is from Bowman (1951) and Prentice (1965), unless otherwise noted.

TINEIDAE

Monopis laevigella - This is the most northerly record known for this holarctic species, but it is probably widely distributed in the northern boreal forest, including into the NWT.

GRACILLARIIDAE

Caloptilia sp. prob. *betulivora* - This boreal forest species appears to be common and widespread, but it cannot be reliably separated from other closely related species.

TORTRICIDAE

Range and host information is primarily from Heinrich (1923, 1926).

Phaneta tarandana - This record lies at the northern edge of the known distribution for this uncommon species. Nothing is known of its biology.

Ancylis goodeliana - This record lies at the northern edge of the known distribution for this uncommon species. Nothing is known of its biology.

CRAMBIDAE

Parapoynx maculalis - This species was listed as rare when it was collected in La Butte Creek Wildland Provincial Park in 2001. It has since been collected here and elsewhere in the province, so its abundance is hereby downgraded to Uncommon. It is widespread but very localized, occurring only in habitats where its aquatic host plants (*Nuphar*, *Nymphaea*, *Brasenia* spp.) are found.

Ostrinia marginalis - This species is uncommon, but distributed widely across northwestern North America. Nothing is known of its biology.

PTEROPHORIDAE

Capperia ningoris - This species is an uncommon resident across Alberta. This record is a substantial range extension, having only been found in the southern boreal until now.

Summary and Conclusions

A total of 138 Lepidoptera species were collected on this survey of which 52 are microlepidoptera, and 86 are macrolepidoptera, including 20 butterflies. Although the majority of these species are typical inhabitants of the boreal forest of western North America, some species were previously considered to be inhabitants of the mountain or grassland ecosystems. Some species records are at the edge of their known range, and many records represent considerable northern range extensions. Three butterfly species *Papilio machaon hudsonianus*, *Limenitis archippus*, and *Oeneis chryxus caryi* are classified as uncommon. All occur in the boreal forest but exist in localized populations. Six macro-moth species (*Nemoria mimosaria*, *Hyalophora gloveri*, *Clostera brucei*, *Lomanaltes eductalis*, *Drasteria hudsonica*, and *Heliothis borealis*) are classified as uncommon. Five micro-moth species (*Phaneta tarandana*, *Ancylis goodeliana*, *Parapoynx maculalis*, *Ostrinia marginalis*, *Capperia ningoris*) are considered to be uncommon, although their status may change with more intensive collecting. With further sampling many more riparian and Canadian Shield specialists await discovery in the region.

Acknowledgements

This report would not have been possible without the assistance of members of the Alberta Lepidopterists' Guild, particularly Gerald Hilchie and Wayne Nordstrom (who collected specimens along with the author). Thanks are also due to Lorna Ash, Duncan Hilchie, Ted Johnson, and Terri MacKinnon who collected specimens during their July visit to Colin-Cornwall Park. Gary Anweiler and Chris Schmidt provided and confirmed many identifications.

The opportunity to inventory the lepidoptera was made possible through an invitation to the members of the Alberta Lepidopterists' Guild from the Alberta Natural Heritage Information Centre of the Parks and Protected Areas Division. In addition, parks staff of the Lac La Biche District made this project feasible by providing logistic support, including transportation, field camps and food. Without the efforts of Ted Johnson, Jennifer Okrainec and the rest of the parks staff along with the field camp crew, this project would not have been possible.

Appendix 1: Complete data for specimens collected at Colin-Cornwall Lakes Wildland Park.

Abundance categories are as follows: abundant (A); common (C); uncommon (U). Higher classification follows Kristensen (1999) except NOCTUIDAE sensu Poole (1996); nomenclature follows Poole (1996) except as noted by an asterisk. MONA Numbers follow Hodges et al. (1983); new species and incomplete determinations inserted with decimals. Note: for those species highlighted in yellow, see the Errata sheet at the beginning of the report.

Appendix 2: List of Species found in Colin-Cornwall Wildland Park

Higher classification follows Kristensen (1999) except Noctuidae sensu Poole (1996); nomenclature follows Poole (1996) except as noted by an asterisk. MONA Numbers follow Hodges et al. (1983); new species and incomplete determinations inserted with decimals. Note: for those species highlighted in yellow, see the Errata sheet at the beginning of the report.

MONA No.	Family	Genus species subspecies	Locality	Dec. Lat.	Dec. Long.	Date	Collector	Method	Habitat	Life Stage
415.00	Tineidae	Monopis laevigella	Esker Lake, basecamp	59.55533	110.26180	July 08-09, 2002	GH, LA, DH	UV trap	Salix with Spruce	Adult
