INTRODUCTION

The Wainwright Dunes Ecological Reserve is located in the eastern portion of the Parkland Natural Region in Alberta, approximately 30 km SSE of the town of Wainwright, and adjacent to the southern border of the southeastern arm of CFB Wainwright. This 2 821 ha (6 970 ac.) area is an Ecological Reserve established under legislation administered by Alberta Community Development, Parks and Protected Areas, and managed in cooperation with Alberta Sustainable Resource Development, Public Lands Division.

This is a collection of the location, plant number, habitat and associated specimen collection, photographic and mapping information for the 11 species of vascular plants that were recorded in the Wainwright Dunes Ecological Reserve during the 2002 rare plant survey by Ian D. Macdonald, and for the additional eight species that previously were reported in the Reserve and its vicinity by previous studies (Bradley & Bradley 1977, Fehr 1984, Cottonwood Consultants, Ltd. 1986, Pearson Timberline Forestry Consultants 1993, Wallis 1990, Johnson 1992, Anon 1998, Cotterill 2000, Meijer 2001, ANHIC 2002). This study was conducted in order to provide additional information of those provincially rare plant species that had been reported from the area. This is a companion volume to a report prepared for Alberta Sustainable Resource Development, Public Lands Division, Edmonton (Macdonald 2003). Additionally the information will contribute to the Rare Plant Data Base of the Alberta Natural Heritage Information Centre, Alberta Community Development, Parks and Protected Areas Division, Edmonton. A compilation volume of the photographs documenting the species locations and habitats, and a file of the species plant location and habitat diagrams are retained at the Alberta Natural Heritage Information Centre offices and at the Wainwright Field Office of Alberta Sustainable Resource Development, Public Lands Division.

The author may be contacted if additional clarification is required for the enclosed information at 1916 S 30 St, Terre Haute, IN 47803, tel. (812) 238-0443, or through the ANHIC offices.

METHOD

Alberta Sustainable Resource Development, Resource Data Branch contracted the author to conduct an inventory of the provincially rare vascular plants that had been reported from within the Ecological Reserve with a view to confirming their locations, habitats, population sizes and potential habitat threats and management concerns in order to provide a better understanding of their situation and requirements, to provide effective management for their protection and maintenance and to provide a database for documenting their occurrences.

Prior to and concurrent with the on-site survey, the above listed references and authorities were consulted to gain a familiarity with the natural features of the Ecological Reserve and to form a "search image" for the various species; this was documented in the Preliminary Report (Macdonald June 2002). Previously reported records for provincially rare species were relocated by referring to the ANHIC (2002) data base for rare species, and where possible, to the several reports on the natural features of the Reserve (listed above) and through interviews with authorities familiar with the area (Harry Loonen and Patrick Porter, Alberta Sustainable Resource Development, Public Lands Division, Wainwright and Cliff Wallis, Cottonwood Consultants, Ltd., Calgary). In many cases, these reports served as a guide to the discovery of new locations for the provincially rare species in the Reserve.

The 2002 on-site investigation rare vascular plant survey of the Wainwright Dunes Ecological Reserve was conducted by the author within the Reserve's boundaries, and occasionally just beyond them, over a 20 day period in the 2002 growing season in early summer (13–16 June), mid-summer (10–12, 14–21 July) and late summer (15–19 August). The survey of the rare vascular plants followed the general guidelines recommended by the Alberta Native Plant Council (Lancaster 2000). During this phase of the project the author conducted a survey of the apparent potential habitat situations for the various species as was possible in the time-frame allowed within the study area. Due to their potential for supporting rare vascular plant species, particular attention was given to those habitats associated with the sand dune ridge blowout, seepage slope, patterned fen, lake backshore to offshore, and other wetlands. All species locations were accessed on foot to minimize damage to the sensitive terrain and vegetation, and allowed a more thorough survey along the routes between them. Rare species locations that were discovered were temporarily demarcated on the ground with flags so that the number of individuals could be accurately counted or estimated, and their extent measured and mapped, and individuals collected for verification, but only where the population would not be compromised. The results of the investigations were recorded on-site with the author's open file format, copies of which submitted to Alberta Sustainable Resource Development, Resource Data Branch office in Edmonton, and are retained on file at the

Alberta Natural Heritage Information Centre, Alberta Community Development, Parks and Protected Areas Division offices in Edmonton. This information included all the data requirements of Alberta Environment's Site Description Form and ANHIC's Rare Native Plant Report Form. The following critical items were recorded: 1) rare species name; 2) location using a GPS unit (Eagle Explorer 1996) to determine latitude and longitude to degree and minute in thousandths and occasionally the 1927 datum Universal Transverse Mercator grid coordinates (UTM27) as well, and where accuracy was ensured, an aerial photograph was pierced and labelled at the exact or nearest accurate point; 3) site characteristics, including terrain type, substrate, moisture regime, aspect and slope; 4) associated community pattern, noting for each of the species the tree, tall shrub, low shrub and herb strata they occurred in, and their cover values in closure categories of >95%, 75–95%, 50–75%, 20–50%, 5–20%, 1–5% and <1%; 5) extent and number of individual plants by direct count or estimation as defined by the growth characteristics that appeared to be appropriate for enumerating the species, such as with discrete individuals, or leaf and inflorescence clusters along a rhizome chain; 6) phenology and growth condition of the rare plant species indicating stage of development, flowering or fruiting success; 7) present and potential threats to the habitat and the immediate vicinity; 8) notes on potential management concerns for the species; 9) notes on field identification characteristics that might aid future surveyors in locating the species; 10) map using planar view or oblique pictorial viewpoint indicating the species' extent in the area and the position of the pink surveyor's flagging tape that acts as a permanent reference to mark the location; 11) photograph to illustrate the plant growth, habitat detail and population extent; and 12) collection number of the rare and other associated species for future herbarium label preparation.

Following the on-site survey, the collected specimens were prepared by drying, then determined or confirmed by the author, inspected and confirmed by Bonnie M. Smith of the University of Calgary Herbarium, and sent to ANHIC in Edmonton for further confirmation by Patsy Cotterill at Alberta Community Development, Parks and Protected Areas. They were deposited for future reference in the herbaria of the University of Alberta (ALTA) and Alberta Community Development, Parks and Protected Areas (PP), both in Edmonton and of the University of Calgary (UAC) in Calgary. The on-site notes were clarified and corrected where necessary, and critical habitat information pertinent to the Ecological Land Survey Description forms of Alberta Sustainable Resource Development and the Rare Native Plant Report Information form of ANHIC were prepared, and the collected species data were summarized in the formatted presentation as species location reports for each of the rare species (see below).

SPECIES LOCATION DATA REPORTS

The following text summarizes the overall findings for each of the 19 provincially rare vascular plant species that have been reported from or have been discovered within the Wainwright Dunes Ecological Reserve and its immediate vicinity. The information for each species is presented in two sections, the first an overall summary and includes its current provincial Rank in Alberta (Vujnovic & Gould 2002), a brief description of the major diagnostic characteristics by which the species may be distinguished from similar species, its continental and provincial distribution and location within the Ecological Reserve, the population size and extent at the locations, the habitats which support the species, habitat threats, and management concerns. Also included are a map indicating the locations of the species locations within the Ecological Reserve, and a selected photograph that illustrates the growth habit of the plants in the Reserve, a list of the cited references, and the following four tables: 1) summary of the information required in the Alberta Environment Ecological Land Survey Site Description Form and the ANHIC Rare Native Plant Report Form; 2) summarizing the map/date site codes, location coordinates (lat./long. or UTM27), number of plants and extent of the plants at the site, and general habitats for the species; 3) a summary of the available photographs from the Reserve that illustrate the plants and their habitats; 4) sketch maps and line diagrams of the habitats and the locations of the plants within the sites.

The second section is a more detailed and formatted information presentation for each species as individual element occurrence reports, which are accompanied by the figures of planar or oblique view of the locations and population extents, and the complete set of photographs taken during the survey to illustrate the species' growth habits, inflorescences, populations and habitats. The format for each of these reports is as follows:

map/date site: The identifying number assigned to each species location for each known record from the past and current encounters with the species was derived from the date of the observation following the format year/month/day (yymmdd) with the alphabetical sequenced occurrence of the site on that day, as for example, 020722e is the fifth site on 22 July 2002. Additionally, for mapping purposes a simpler code of the first letter of the genus and species with a chronologically sequential number was used, as for example, As3 is the third record from the Reserve of *Asclepias ovalifolia*.

location: Locations of the species locations are identified as actually being either within the present boundaries of the Wainwright Dunes Ecological Reserve (WDER) or rather adjacent to it. For general orientation purposes, these further are located within the study area as a distance and general compass direction from a standard point, being

the cattle post (called the "monument") near the southern end of the peninsula at the northwestern end of David Lake. More accurate locations are presented as latitude and longitude to thousandths of a minute (approximately 5 m for latitude to 2.5 m for longitude) to an accuracy of 0.025 minutes (and often actually 0.005 minutes), derived at the site from a GPS reader (Eagle Explorer 1996). As well, the Universal Transverse Mercator grid for the 1927 datum (UTM27) measurement is occasionally provided, also derived from GPS readings at the site.

collections: Specimens of the significant species were taken at least once from within the area, but only where the population would not be compromised, following the guidelines of Lancaster (2000). These specimens were prepared acccording to standard herbarium procedure, labelled and deposited in a recognized herbarium in Calgary (UAC – University of Calgary) and / or Edmonton (ALTA – University of Alberta), or elsewhere as directed (PP – Alberta Parks and Protected Areas). Otherwise, where the population size or conditions were not appropriate, photographs and partial specimens sufficed for confirmation purposes. The collections of the author were numbered according to a sequential number from the collection date and site (see above), as for example, 020722e2 is the second collection at the fifth site on 22 July 2002.

photos: 35 mm colour photographs were taken of a view of the general site and habitat, a more detailed view of a typical portion of the habitat to ascertain the associated community and plant conditions, and a portrait of a representative plant of the species, and other details of the plants (inflorescences, foliage) were taken where appropriate. These photos are presented in the accompanying compendia, and are identified according to their roll number and frame number; for example, E4 is roll E and frame 4 in that roll. They also are identified with the site's number, latitude / longitude on the back of at least one copy, and a brief description of the feature that is illustrated.

plant numbers: The number of individual plants and dimensions of the area which the population occupied is presented, as well as whether the population occurred in separated clusters, their sizes and dimensions, the phenological condition of the population, and other pertinent observations on the species at this location.

note: This category includes pertinent observations on related information about the site conditions, population or habitat, present or potential threats, and management considerations, and whether it was associated with other rare species.

habitats: The general site characteristics are summarized, indicating landform, substrate, moisture regime, aspect, slope and physical situation. The associated plant

community and species are presented as a general vegetation class with the several strata and component species listed in order of decreasing cover value in the following percentage cover value groupings: >95%, 75–95%. 50–75%, 20–50%, 5–20%, 1–5%, and <1%, as for example, "sand dune ridge upper slope (3? toward 105° – SSE) and crest in subxeric sand with young semiopen grove of TREE (semiclosed to semiopen) Populus tremuloides; SHRUB (semiopen) Prunus virginiana – Corylus cornuta; HERB (semiclosed to closed) 50–75% Agropyron trachycaulum – Thalictrum venulosum – Carex siccata; 5–20% Thermopsis rhomboidea – Galium boreale; 1–5% Oryzopsis asperifolia; <1% Schizachne purpurascens – Achillea millefolium – **Asclepias ovalifolium –** Solidago missouriensis"

For each of the rare species reports, the reader is referred to the accompanying compilation volume of the photographs documenting the species habitat and locations, and the file of the species plant location habitat and diagrams are retained at the Alberta Natural Heritage Information Centre offices, and at the Wainwright Field Office of Alberta Sustainable Resource Development, Public Lands Division.

Botrychium multifidum (S.G. Gmelin) Rupr. **var. *intermedium*** (D.C. Eat.) Farw.**—leather grape fern—OPHIOGLOSSACEAE**

This low woodland and field fern has a provincial Rank of **S2** in Alberta and a global rank of **G5T4?** (Vujnovic & Gould 2002, ANHIC 2002). NatureServe (2003) indicated that the authorities for this species are (Gmel.) Trev., and that its other common name is "leathery grape fern". This is one of the more readily recognizable grape ferns in the province. Like the one other large-leaved grape fern that occurs in the province, *Botrychium virginianum* (Virginia grape fern), its sterile blades are relatively large (10 to 25 cm wide, 15 to 35 cm long) and are divided two to three times; however, it differs in that its petiole attachment is near the base of the stalk, the blades are leathery, and it persists through the winter (Moss 1983, Scoggan 1978). It occurs in Alberta as the var. *intermedium* (D.C. Eat.) Farw. (Moss 1983), but the nomenclatural treatment of Wagner & Wagner (1993) in the *Flora of North America* did not recognize this variety.

This species extends across central North America in the boreal and northern temperate zones between Alaska and Newfoundland, and south to California to West Virginia (Wagner & Wagner 1993). It is rare in three provinces, including Alberta, Prince Edward Island and Newfoundland (as well as Labrador), and in ten states (NatureServe 2003). Within Alberta it occurs at 34 known locations, extending between Grande Prairie and east southeast to just east of Edmonton, including an isolated location north of Lake Athabasca (ANHIC 2003, Kershaw *et al.* 2001). The location from the Wainwright Dunes Ecological Reserve was not mapped in the *Rare Vascular Plants of Alberta* (Kershaw *et al.* 2001) or listed in Fehr 1984, but the Element Occurrence Data Base of ANHIC (2003) listed one species location about 400 m north of David Lake, discovered by Patsy Cotterill and others in July 2000. The apparently exact UTM27 grid location within the Ecological Reserve was relocated during the present survey; however, no plants were rediscovered there or in its general vicinity. Further, the anticipated habitat was not an aspen forest as indicated in Cotterill's specimen label, but rather was a balsam poplar forest with an opening, both of which supported a rich complement of northerly species in the gently undulating mesic sand plain that was somewhat removed from the base of the low bluff slope well north of the present-day David Lake shore. Nevertheless, both the closed forest and opening were surveyed to ascertain their Ecological Land Site characteristics.

Patsy Cotterill (2000) reported that she had recorded 20 plants in the area. In this species, the leaves should persist throughout the year with new leaves developing by early to mid-summer, and the fruiting heads should have developed by mid-summer. However, no plants at all were observed during the 2002 survey, and Cotterill (2003 personal communication) confirmed that the surveyed habitat did not conform to her recollection of her species location.

The habitat that was surveyed during 2002 was a mesic, gently rolling sand plain with a balsam poplar forest and an adjacent shrubby clearing, both of which supported a complement of northerly herb species. The forest had a semiclosed to closed tree cover of *Populus balsamifera*, a semiclosed to semiopen tall shrub cover of *Salix bebbiana*, *Prunus virginiana*, *Corylus cornuta*, and *Amelanchier alnifolia* (saskatoon), and low shrub cover of *Cornus stolonifera* and *Symphoricarpos occidentalis*, and a semiopen to semiclosed herb cover of *Aralia nudicaulis*, *Rubus pubescens*, *Oryzopsis asperifolia*, *Viola canadensis*, *Lysimachia ciliata* (fringed loosestrife), *Thalictrum ?occidentale*, and other rich lowland forest species. The clearing supported a semiclosed to locally open tall shrub cover of *Prunus virginiana*, *Amelanchier alnifolia* and *Corylus cornuta*, semiclosed low shrub cover of *Rosa acicularis*, *Symphoricarpos occidentalis* and *Rubus idaeus*, and a semiclosed herb cover of *Schizachne purpurascens*, *Oryzopsis asperifolia*, *Galium boreale* and others.

Habitat threats to the species could not be determined at this time; however, none were apparent at the location that was surveyed in 2002. The past cutting that formed the clearing may have imposed some impact on the site conditions for the species. No signs of grazing were evident.

Management considerations must first be to relocate the plants, which should be expected still to be standing since they generally tend not to be ephemeral nor intermittent in their yearly growth and are tall enough to be relatively obvious.

habitat: "aspen forest below slope fen and above upper north shore of David Lake; with Alnus crispa, Rubus idaeus, Rosa (species), Symphoricarpos occidentalis" // 660 m
comment: this UTM27 location is about 400 m north of the north shore of David Lake; it was surveyed (see below), but no plants were discovered

RECENTLY DISCOVERED SPECIES LOCATIONS

map/date site Bm2 – Botrmul-020819c
location: Wainwright Dunes Ecological Reserve; north of David Lake, about 1 km N of peninsula monument; 15–2–42–5W4; see map Bm2
lat./long.: (centre) 52°35.553'N / 110°36.686'W [0.025'] [calculated]
UTM27: (centre) 12N 0526322E 5826805N [30m] [GPS]
collection: none
photo: none

plant numbers: no plants relocated

note: the UTM27 coordinates for the element occurrence were indicated by ANHIC as being P. Cotterill's 15 July 2000 location for this species; however, the site that was relocated during this current survey indicated a quite different habitat; two potential habitats were surveyed: 1) poplar forest, 2) opening in poplar forest; no plants observed; nevertheless, this forest composition did include northerly floristic elements; note the record for Thalictrum occidentale (based on vigorous vegetative specimen)

habitat 1: gently rolling mesic sand plain with deciduous forest of TREE (closed) >95% Populus balsamifera; TALL SHRUB (semiclosed to semiopen) 5–20% Salix bebbiana; 1–5% Prunus virginiana – Corylus cornuta; <1% Populus tremuloides (sapling) – Populus balsamifera (sapling); LOW SHRUB (semiclosed) Prunus virginiana – Amelanchier alnifolia; 20–50% Rosa acicularis – Prunus virginiana; 5–20% Cornus stolonifera – Symphoricarpos occidentalis; 1–5% Symphoricarpos albus – Viburnum edule; <1% Ribes oxyacanthoides; HERB (semiopen to semiclosed) 50–75% LITTER; 5–20% Aralia nudicaulis – Rubus pubescens – Oryzopsis asperifolia – Viola canadensis; 1–5% SOIL (sand) – Galium boreale – Maianthemum canadense – Lysimachia ciliata – Thalictrum ?occidentale; <1% Smilacina stellata – Schizachne purpurescens – Actaea rubra – Bromus ciliatus – Lilium philadelphicum – Solidago canadensis – Linnaea borealis – Viola adunca – Lathyrus ochroleucus – Achillea millefolium – Pyrola asarifolia – Sanicula marilandica – Osmorhiza depauperata – Petasites vitifolius – Lonicera dioica

habitat 2: gently rolling mesic sand plain with opening in deciduous forest of TREE (extremely open) 1–5% Populus balsamifera; TALL SHRUB (semiclosed to semiopen) 75-95% Prunus virginiana; 5–20% Amelanchier alnifolia; 1–5% Populus tremuloides (saplings) – Corylus cornuta; LOW SHRUB (semiclosed to semiopen) 20–50% Rosa acicularis – Symphoricarpos occidentalis; 5–20% Corylus cornuta – Prunus virginiana; <1% Rubus idaeus subsp. melanolasius; HERB (semiclosed) 50–75% LITTER; 5–20% Schizachne purpurascens – (unidentified grass); 1–5% Oryzopsis asperifolia – Fragaria virginiana – Taraxacum officinale; <1% Achillea millefolium – Galium boreale – Campanula rotundifolia

Najas flexilis (Willd.) Rostk. & Schmidt.**—slender naiad—*NAJADACEAE***

This submergent and rooted, annual aquatic herb of pond and stream habitats has a provincial Rank of **S1S2** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). It is the only member of its genus in Alberta, and has a rooted erect stem with many alternating branches, although they often are broken, and with narrow linear leaves in what appear to be whorls of four, that actually are subopposite pairs. It has single, very simple, tiny flowers in the axils of the lower of the subopposite leaf pairs, and single pairs of small, elliptic achenes. The bushy appearance of this species, particularly in late season, allows it to resemble some of the small-leaved *Potamogeton* species, and perhaps even the rare *Elodea bifoliata*. However, it differs from the former in having narrow, serrate leaves that have notably and abruptly broader, clasping bases and no stipules, and from the latter in not having simple opposite leaf pairs (Moss 1983, Fassettt 1957. Muenscher 1972, Voss 1967).

This species occurs across most of North America, is rare in Alberta, Saskatchewan and Prince Edward Island, and in two states, and is may have been extirpated from one state (NatureServe 2003, Kershaw *et al.* 2001). In Alberta it has been recorded from seven locations the Parkland and adjacent southwestern Boreal Natural Regions (ANHIC 2003). The Wainwright Dunes Ecological Reserve appears to be the only known location in the eastern portion of the Parkland Natural Region, and it was first reported in the Ecological Reserve through a collection of A. Fehr in 1983, but was not listed in his list of the Reserve's flora (Fehr 1984). This collection apparently was taken from the large pond on the southeastern side of the Great Fen (ANHIC 2002), about 2.5 km northwest of David Lake. However, the 2002 survey of the reserve did not rediscover any plants in this large pond or in other suitable wetland sites.

There was no information on the number of individuals provided in the collection data for the single known specimen from the reserve.

The wetland habitat of the "beaver pond" that the collection label for this species apparently refers to has experienced considerable drawdown due to the prolonged regional drought conditions between 2000 and 2002. Some standing water still occurred in the central portions of the wetland basin; however, the extent of the exposed barren soils along the drawdown fringe was very great. The survey of the pond area during the 2002 survey discovered several species of *Potamogeton*, *Potamogeton pectinatus*, *Potamogeton zosteriformis* (flat-stemmed pondweed) and *Lemna minor* (common duckweed), but little else in the aquatic flora. The species' persistence here may require beaver activity to maintain the dam that keeps the water level high.

The major habitat threat to this species within the reserve is the considerable and long

term drawdown situation in the beaver pond basin where it was reported over 20 years ago. The regional drought conditions probably have greatly worsened this situation, and probably also has resulted in the apparent loss of the active beaver population to maintain the dams and ponds.

Management considerations should be to resurvey the beaver pond at the southeastern end of the Great Fen, and the other beaver ponds in the reserve, in hope of rediscovering the species. Such surveys in the mid-summer season should prove more productive if the species still persists. The actual collection location of the known specimen may be in doubt, since, while this may be just a clerical error, the latitude / longitude coordinates on the specimen label indicated a point in the sandland about 2 km due west of David Lake where no pond feature exists. As well, the species was not included in Fehr's otherwise meticulously inclusive general species list for the reserve and its vicinity and was not repeated in the compilation list in the Ecological Reserve's management plan (Anon 1998).

observation:	Fehr 27 July 1983
collection:	1983-07-27 // Fehr, A., L. Charbonneau, L. Allen & M. Bailey // PMAE#B86.17.30 // ID-OK // specimen source code S83FEHPMABCA04
photo:	no information
plant numbers:	no information
note:	fruits present [on specimen]
habitat:	"beaver pond" // 670m
comment:	The wetland that this collection probably refers to has been considerably drawn down by the present drought. Standing water still occurred in the central portions of the wetland basin, but the drawdown fringe was very extensive. The species' persistence may require beaver activity to maintain the dam that would keep the water level high. Specimen not inspected by IDM in 2002. Latitude / longitude coordinates on PMAE specimen sheet indicate a location about 2 km west of David Lake, where no pond feature exists.

Ruppia cirrhosa (Petagna) Grande**—widgeon-grass—*RUPPIACEAE***

This aquatic herb of saline and alkaline lakes, ponds and ditches has a provincial Rank of **S1S2** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). Its leaves are 5 to 20 cm long and less than 0.5 mm wide in fan-like groups, with sheathing, scarious-margined stipules that are 5 cm to 20 cm long, with very un-*Potamogeton*-like inflorescences consisting of pairs of tiny flowers with no petals and two stamens borne on a spadix from the upper leaf axils, with fruits developing at the tips of four branches in umbel-like clusters atop distinctly coiled culms. While this species is distinctive in its fertile state, it is difficult to differentiate from the similar *Potamogeton pectinatus* in its vegetative state, and may initially also be mistaken for *Potamogeton filiformis* (thread-leaved pondweed). Voss (1967) presented several useful vegetative characteristics to aid in its recognition and to separate it from the genus *Potamogeton*, as follows: sheath with no free ligule at summit, *i.e.*, the stipule wholly adnate to leaf blade, merely rounded at summit (not with a short ligule-like extension of the free stipule at the summit, *i.e.*, the stipule only partly adnate, as in *Potamogeton*); leaf blade terete (not flattened); fruit stalked in an umbel-like arrangement on a spiraled and elongating limp peduncle (not sessile or subsessile in a spike with a straight stiff peduncle). The genus formerly was treated as one species, *Ruppia maritima* L. (formerly called *Ruppia occidentalis* S. Wats.); however, recent taxonomic treatment has restricted that species name to apply to maritime coastal plants, while the name *Ruppia cirrhosa* (formerly called *Ruppia spirillis* L. *ex* Dumort) to apply to continental western North American plants.

This is a circumpolar species that occurs in the western half of North America from the Arctic southward into Central America. It is rare in Alberta, Manitoba and Northwest Territories, and also in two of the western states, and may have been extirpated from one state (NatureServe 2003, Kershaw *et al.* 2001). In Alberta it has been reported from six known locations in the southwestern corner of the Grassland Natural Region and the vicinity of Edmonton in the Parkland Natural Region (ANHIC 2003). Its only reports from the eastern portion of the Parkland Natural Region were those of Fehr (1984) and Cottonwood Consultants, Ltd. (1986) who reported it from the David Lake basin off the eastern side of the peninsula, apparently in the then standing waters of the lake. This species was not relocated during the 2002 survey of the Ecological Reserve. The extensive drawdown conditions in the entire David Lake basin have rendered the site no more than a big salty parking lot. The entire chain of dugout channels in the basin created by Ducks Unlimited were examined, but no water at all remained in them, and while the two larger dugouts in the basin held some water, no aquatic plants of any sort were observed there. Additionally, the dugout along the Reserve's eastern boundary about 1.8 km north of David Lake, and that to the east of the Reserve boundary on the northeastern backshore of David Lake, were surveyed for populations of this species, but none were found.

No information on the number of individuals was available in the several reports for this species' occurrence in the Ecological Reserve, and no plants were relocated during the present survey. It may be that the species has been thoroughly decimated by the drought conditions, and possibly it is even extirpated from the Reserve's flora.

The habitat for this species was indicated by Fehr (1984) to be "submergent" in the then standing waters of David Lake, and the report of Cottonwood Consultants, Ltd. (1986) indicated it to be in "extensive marshes and open water" of the lake, offshore from the central eastern side of the David Lake peninsula. Both of these surveys were conducted in relatively wet years with David Lake being at a high water level. However, the present survey was conducted in a period of extreme drought, and no standing water at all was recorded except in the larger dugouts which had very dark waters from cattle excrement leachate. The relatively cleaner waters of the dugout located along the Reserve's eastern boundary to the northeast of the lake's backshore, and of the several ponds in the interior of the Reserve, did not have this species, although several species of *Potamogeton* were noted, including the similar *Potamogeton pectinatus*, and particular care was taken during the 2002 survey in their determination to ensure that these were not *Ruppia cirrhosa*.

The major habitat threat to this species in the reserve are the prolonged regional drought conditions and with their drawdown effects on the water level in the David Lake marshes where it was originally reported.

Management considerations for this species would entail resurveying the previously known and potential wetland habitats where it previously had been reported during a moister climatic period when David Lake hast higher water levels. Additionally, any vouching specimens should be reexamined and confirmed, since the record was not included by ANHIC (2002) and Kershaw *et al.* (2001) in their mapping for the province. At this time, it appears to be likely that the species has been extirpated from the vascular plant flora of the Ecological Reserve.

Elodea bifoliata St John.**—two-leaved waterweed—H*YDROCHARITACEAE***

This perennial aquatic herb of slough, pond, lake and stream habitats has a provincial Rank of **S1** in Alberta, and a global Rank of **G4G5** (Vujnovic & Gould 2002, ANHIC 2002). This species, which has also been known as *Elodea longivaginata* St. John, is rooted and completely submergent, with branching stems. It has paired leaves that are opposite, about 2.5cm long and 2mm wide and are not crowded in the middle to upper portions of the stem. Its flowers, have three tiny white petals, and are on long stalk-like tubes that extend from the leaf axils to the water surface, and produce a small capsule. It may readily be distinguished from *Elodea canadensis* Michx. (Canada waterweed), which has yet to be confirmed from the province, which has shorter (1.7 cm) and broader (2 to 4 mm) leaves that are in whorls of three and are notably crowded along the middle to upper stems. Additionally it differs from the more eastern *Elodea nuttallii* (Planch.) St. John (Nuttall's waterweed) which also has long, narrow (0.3 to 1.5 mm) leaves that are not crowded, but are in obvious whorls of three (Fassett 1957, Muenscher 1972, Voss 1967). At first glance it may be confused with the rare *Najas flexilis*, but that species has apparent whorls of four leaves (see preceding species summary).

This species occurs in the mid-western North America, is rare in Alberta and Saskatchewan and two northern states, and is considered to have been extirpated from one state (NatureServe 2003, Kershaw *et al.* 2001). It occurs in Alberta at eight known locations in the Grasslands and western Parkland and adjacent southern Boreal Natural Regions (ANHIC 2003). However, it was not mapped from the eastern portion of the Parkland Natural Region in *Rare Vascular Plants of Alberta* (Kershaw *et al.* 2001). Its only report from the Wainwright Dunes Ecological Reserve has been that of Fehr (1984), who listed it as "*Elodea canadensis*" in the general species list, but gave no location and did not include it in any of his community stand data tables. However, if it does occur within the Reserve, his stated habitat would indicate the pond to the southeast of the Great Fen as being one of several likely locations. The reference floral text for Alberta that Fehr probably used when he conducted his survey would have been the then recently published *Flora of Alberta* of Moss (1959) which listed both *Elodea canadensis* and *Elodea nuttallii*, and not the later version of 1983 which listed only *Eleocharis longivaginata* St. John in the province. *Elodea canadensis* is an aquatic species that still has not been confirmed from Alberta, and so his record may well have been an understandably mistaken identification of the rare *Elodea bifoliata*. However, Fehr's record was not repeated in the general accumulative species list that appeared in the Reserve's management plan (Anon 1998) which apparently was edited by several knowledgeable authorities, and who may have excluded the record as being unsubstantiated. The species was not observed during the 2002 survey of the Reserve, and hence its inclusion in its rare flora as based on this record is tentative.
There is no information on the number of individuals of this species within the Ecological

Reserve, and the only likely habitat is "pools in willows and some beaver ponds" (Fehr 1984, Appendix 5), which could imply that is was recorded at several locations and in at least two habitats, although the pond southeast of the Great Fen is more probable. There was no information about associated species in the communities, although there may be several associated species of *Potamogeton* and other aquatics.

The major habitat threats to this species within the Reserve are the prolonged regional drought conditions and their effects on the water level in the beaver pond where it was originally reported. Such habitats were examined during the 2002 survey but no plants were recorded.

Management considerations for this species should include a resurvey during a wetter climatic period of the previously known and potential wetland habitats from which it previously had been reported by Fehr. Additionally, any existing vouching specimens should be found, reexamined and confirmed, since the record was included by neither ANHIC (2002) nor Kershaw *et al.* (2001) in their rare species mapping for the province.

Muhlenbergia asperifolia (Nees & Meyer *ex* Trin.) Parodi**—scratch grass—*POACEAE***

This distinctive low grass of moist alkaline soil has a provincial Rank of **S2** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). It is a perennial grass that has a thin, scaled rhizome, with procumbent tips from which arise stems with somewhat keeled leaf sheathes, and a notably diffuse panicle, 4 to 12 cm wide, that is strikingly different from the other *Muhlenbergia* species in the province which have narrow, spike-like inflorescences. Indeed, its overall growth pattern, particularly when the bushy inflorescence is developed, is strongly reminiscent of *Panicum philadelphicum* (woodland witch grass) and *Panicum flexile* (wiry witch grass) of eastern and central North America, or of stunted, low-growing forms of *Panicum capillare* (witch grass), only the last of which also grows in Alberta. However, these other species are annuals, have very different glume sizes, and lack the well-developed overlapping scaled rhizomes that are typical of all species of *Muhlenbergia*. The open panicle has a delicate mauve to light purple colour which makes its presence readily obvious in its habitat, and when dry or mature, they break off from the plant and are blown about to spread their seeds. However, in its preflowering vegetative stages, it looks much like a stunted *Hordeum jubatum* (foxtail barley) and, indeed, probably frequently has been overlooked for this reason; at this stage the presence of rhizomes and lack of hairs on the upper surfaces of the leaf bases would identify the plants as *Muhlenbergia asperifolia* (Moss 1983, Gleason & Cronquist 1991, Fernald 1950).

This species occurs across southern Canada between British Columbia to Ontario (where it is an exotic) and across the United States except in the southern and New England states, and is considered to be rare only in Alberta, but extirpated in New York (NatureServe 2003). In Alberta it has 26 known locations in the Grasslands and eastern Parkland Natural Regions, with two from the general vicinity of the study area (ANHIC 2003). It was first reported from within the Wainwright Dunes Ecological Reserve by Wallis (1990) from the vicinity of the northern shore of David Lake. During the present survey thirteen new locations were discovered within the Ecological Reserve, and four from beyond its boundaries, in four general clusters: 20 to 80 m offshore east of the base of the David Lake peninsula, 10 to 75 m offshore from the southern end of the peninsula; the backshore meadows along the southwestern side of David Lake; and an extensive continuous population along the southeastern to eastern side of the lake.

The number of plants in its locations varied from 50 plants in a 1m X 2 m area with small, local dense to diffuse patches, to an outstanding virtually closed meadow of probably over 3 000 000 plants in a continuous, 150 m X 1 000 m area that extended along the eastern and southeastern offshore of David Lake, but unfortunately, beyond the Ecological Reserve's boundaries. The 2002 survey discovered 72 780 plants within the boundaries of the Reserve, all occurring at 13 locations around the David Lake basin.

The general habitat of this species within the province is "moist alkaline soil" (Moss 1983), and the survey of saline wetlands and springs in the Grasslands and Parkland Natural Regions by Wallis (1900) indicated its occurrence in a "drier community of *Hordeum jubatum*, *Puccinellia nuttalliana*, *Distichlis stricta*" (salt grass) north of Medicine Hat (Old Channel Springs Lake), occurring in association with the rare *Aster pauciflorus*, as is the case here. The behaviour of this species in the Ecological Reserve appears to be reliant of the drawdown condition of David Lake that exposes broad expanses of alkaline sandy soil with a mesic to subhygric moisture regime and, perhaps most importantly, a barren substrate to invade, which it does with a vengeance. The most spectacular habitat in the David Lake basin where the species formed a virtually closed short grass meadow occurs along the lake's entire southeastern and eastern sides. Where it occupied a shoreline to offshore zone that was 150 to 200 m wide, and extended for over 1 000 m along virtually the entire length of the shore. Here it formed three related zonal communities: nearshore (where it was at the higher limits of the normal lake level and formed a 20% to 50% meadow cover that was 20 to 50 m wide), farshore (where it joined *Glaux maritima* in forming a 5% to 20% cover as a 50 m wide zone), and offshore (where it formed a 1% to 5% cover in an closed offshore meadow that otherwise was strongly dominated by *Hordeum jubatum*). Off the eastern and southern shores of the David Lake peninsula, this species occurred on alkaline barrens that were more open but of a smaller extent, in effect being local barrens interspersed among the near- and offshore drawdown meadow communities. Here the species presented a variable cover of 2% to 20%, and often was associated with the populations of the rare *Aster pauciflorus* and *Carex parryana*. As well, the species occurred in the more densely developed, closed graminoid meadows that occupied the backshore and nearshore habitats, as in the southwestern side of David Lake. These were dominated by *Calamagrostis stricta, Juncus balticus, Hordeum jubatum* and *Agropyron trachycaulum* subsp. *trachycaulum* (slender wheat grass), and the species presented a 1% to 5% cover and occurred as an undercover species that often was most readily apparent where grazing had removed the taller grass cover. In at least one instance it displayed it ability to act as an invasive species when it occurred on the disturbed sands of the dugout ditch berm just to the east of the peninsula (site Ma11) with *Hordeum jubatum*, *Agropyron trachycaulum* subsp. *trachycaulum* and several invasive successional species.

As is the case with *Aster pauciflorus*, the main habitat threats to its present condition may well be the reestablishment of the high water levels in David Lake. Presently the plants have successfully invaded the shoreline to offshore zones of the lake basin, and have formed often extensive closed meadows. A return to high water lavels in the basin would drown the present populations. However, there probably is an outstanding seed bank that is produced by the profusely flowering inflorescences, and these seeds are bound to find refuge along the shore, even if as a much narrower zone. The plant appears to be

intolerant of prolonged flooding, so the rhizome may not survive as a propagule with prolonged inundation. Grazing by cattle in the meadows of the David Lake basin appeared to have the effect of opening the cover of taller grasses to expose the shorter plants of this species, and perhaps even to 'release' them to present a denser and more vigorous growth. However, the cattle actually did not appear to selectively eat the species, and any impact appeared to be quite incidental.

Management considerations for *Muhlenbergia asperifolia* in the Wainwright Dunes Ecological Reserve should include monitoring the populations in the David Lake basin to determine if there is any grazing impact. Additionally, the northwestern, western and southeastern portions of the David lake basin were not surveyed in 2001, and it is very likely that other populations would also be discovered there with further survey. In moister climatic conditions when the drought conditions cease and the lake water level is restored, further surveying should be conducted to determine changes in the extent of the populations, and to see if the plants appear elsewhere along the shores. Also, a further survey should examine the shores of the Great Fen pond and the other streams and seeps within the reserve; while no populations were discovered in these habitats in 2002, nevertheless, at least small local populations may be expected.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Muhlenbergia asperifolia* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION

Exposure Type	not apply
Flood Hazard	may be expected (3)
Soil Drainage	poorly drained (6), imperfectly drained (5), moderately well drained (4)
Perviousness	slowly (3), moderately (2)
Site: Macro	plain (7), valley floor (6)
Site: Meso	level (7), depression (6)
Site: Micro	straight (1)
Site: Surface Shape	straight (1)
Ecological Moisture Regime	hygric (7), subhygric (6)
Nutrients	?hypereutrophic (6)
Successional Status: 1	young seral (2)
Successional Status: 2	pioneer (1)
Disturbance Factors	water related (8), grazing (5)

ANHIC RARE NATIVE PLANT REPORT

Phenology: vegetative	mid- to late July, early to mid-August
Phenology: reproductive – inflorescence	mid- to late August
Phenology: reproductive – flower	mid- to late August, early September
Phenology: reproductive – fruit	mid- to late August, early to late September
Habitat Threats	flooding, grazing
Management Considerations	monitoring populations, limiting access

Species location summary for *Muhlenbergia asperifolia* in the Wainwright Dunes Ecological Reserve (+ indicates outside reserve boundaries)

map site / date site	location coordinates	number (size)	habitat

PREVIOUSLY REPORTED SPECIES LOCATION

map/date site: Ma1 – Muhlasp-90xxxxa

location: Wainwright Dunes Ecological Reserve // David Lake // T41-R5-W4 & T42-R5-W4 // UTM27 526500E 5826250N // see map Ma1

source: ANHIC // Element Occurrence PMPOA48070 # 021

reference: Wallis, C. 1990. Reconnaissance Survey of Saline Wetlands and Springs in the Grassland-Parkland Region of Eastern Alberta. source abstract code U90WAL01ABCA

observation: Wallis., C. 1990. (report implies plants observed on site)

collection: no information

photo: no information

plant numbers: no information

note: protect entire wetland basin with sufficient setback; reduce pressure on wet meadow cts [?] west of David Lake

habitat: lakeshore; drier, upper shore; on sandy soil

comment: this location is in the vicinity of the northern David Lake offshore, probably about 1 km NNE of the peninsula monument, NW2–42–5W4; this species not mapped in Cottonwood 1986

RECENTLY DISCOVERED SPECIES LOCATIONS

map/date site: Ma2 – Muhlasp-020815b

location: adjacent to Wainwright Dunes Ecological Reserve; central eastern side of David Lake, NE of E/W fenceline, 1.2 km ESE of peninsula southern tip; N4–1–42–5W4; see map Ma2
lat./long.: (centre) 52°34.900'N / 110°35.885'W [0.025'] [GPS]
UTM27: (centre) 12N 0527100E 5825500N [30m] [map]

collections: 020815a2 (1 replicate @ ALTA / rhizome / leaf: full / inflorescence: young to submature, 15 to 18 cm / flowers: young); 020815b1 (3 replicates @ UAC IDM ALTA / rhizome / leaf: full / inflorescence: semiopen, 12 to 20 cm / flowers: young to mature / fruit / very young)

photos: see also site photos for Aster pauciflorus (020815a); N6 (general habitat: drawdown lake meadow, looking NE) N16 (general habitat: drawdown lake meadow, looking NW, note cattle) O13 O14 O15 O16 O17 O18 (plant detail: plant habit with inflorescence at early to mid-flowering)

plant numbers: estimated over 1 000 000 plants forming a very dense carpet in a 160 m X 500 m area; population extends at least 100 m to NE and over 700 m to SW along the David Lake nearshore (see also 020818k); 60% with inflorescences in mid-flower

note: associated with Aster pauciflorus (020815a) and Carex parryana (020710b 020710c); habitat 1 is immediately adjacent to lake side of thicket fringe which is the high water level of the normal shore level, but now is very dry due to drought drawdown; forms a zone 70 m wide and semicontinuously along shore for over 100 m; none recorded in nearshore or backshore thicket community; habitat 2 extends from 70 m from the thicket fringe for about 60 m to a point about 125 m offshore, and extends NE along shore for over 100 m; it shares this habitat with the rare Aster pauciflorus and Carex parryana; habitat 3 extends from about 125 m offshore from the high shore level thicket as a variable width of 10 to 30 (40) m into the lake's central basin's Hordeum jubatum community, and extends along the offshore to the NE for over 100 m; plants rhizomatous and with bushy inflorescence, like diminutive Hordeum jubatum plants; see mapped figure

habitat 1: drawdown nearshore alkaline barrens of David Lake with semiopen to semiclosed heavily grazed low graminoid meadow of 20–50% **Muhlenbergia asperifolia** – SOIL (alkaline); 5–20% Agropyron trachycaulum subsp. trachycaulum – Agropyron trachycaulum subsp. subsecundum – LITTER; 1–5% Hordeum jubatum – Potentilla anserina – Juncus balticus; <1% Symphoricarpos occidentalis – Cirsium flodmanii – Gentianella amarella – Chenopodium pratericola – Antennaria parvifolia

habitat 2: drawdown offshore alkaline barrens of David Lake with semiopen to semiclosed heavily grazed low graminoid meadow of 5–20% Glaux maritima – SOIL (alkaline) – LITTER – **Muhlenbergia asperifolia**; 1–5% Juncus balticus – Aster pauciflorus – Carex parryana – Hordeum jubatum; <1% Potentilla anserina – Agropyron trachycaulum subsp. subsecundum – Puccinellia nuttalliana – Aster ericoides – Ranunculus cymbalaria – Sonchus arvensis – Scirpus acutus

habitat 3: drawdown offshore alkaline barrens of David Lake with semiclosed to closed lake basin graminoid meadow of 50–75% LITTER; 20–50% Hordeum jubatum; 5–20% Sonchus arvensis; 1–5% SOIL (alkaline) – **Muhlenbergia asperifolia** – Scirpus validus; <1% Glaux maritima – Aster brachyactis

map/date site: Ma3 – Muhlasp-020817b-i

location: Wainwright Dunes Ecological Reserve; David Lake, 700 m NNE of peninsula southern tip, about 35 m off the SW end of the aspen grove on the backshore; NE–2–42–5W4; see map Ma3

collection: none

photo: N25 (general habitat; see Carex parryana for photo)

plant numbers: over 50 counted plants in 35 m X 200 m area

note: associated with Carex parryana (020817d)

habitat: drawdown lake offshore and nearshore hummocky alklaine barren with closed shortgrass meadow of 20–50% Potentilla anserina – Agropyron trachycaulum subsp. subsecundum – LITTER; 5–20% Juncus balticus; 1–5% SOIL (alkaline) – Glaux maritima – **Muhlenbergia asperifolia** – Antennaria parvifolia – Hordeum jubatum; <1% Muhlenbergia richardsonii – Agrostis scabra – Solidago canadensis – Senecio pauperculus – Symphoricarpos occidentalis – Aster ericoides – Potentilla pensylvanica – Gentianella amarella – Cirsium flodmanii

map/date site: Ma11 – Muhlasp-020817e

location: Wainwright Dunes Ecological Reserve; David Lake, NW offshore along

dugout berms for duck habitat improvement; this is the fifth berm pile SW of the bend in the line of berms, 500 m NE of peninsula southern tip; 7NE–2–42–5W4; see figure and map Ma11
lat./long.: (centre) 52°35.200'N / 110°36.652'W [0.025'] [GPS]
UTM27: (centre) 12N 0526365E 5826145N [30m] [map]

collection: none

photo: P3 (general habitat: drawdown lake bed dugout channel berm, Muhlenbergia to left, channel to right)

plant numbers: 500 plants counted in 4 m X 6 m area; 40% in full inflorescence at early to mid-anthesis

note: species acting as initial successional plant here

habitat: berm of drainage channel offshore in drawdown lake bed in association with Hordeum jubatum – Agropyron trachycaulum subsp. trachycaulum – Taraxacum officinale – Sonchus arvensis – Agropyron repens [general survey only]

map/date site: Ma12 – Muhlasp-020818b

location: Wainwright Dunes Ecological Reserve; David Lake, 150 m S of peninsula southern tip; NW2&NE3–2–42–5W4; see figure and map Ma12
lat./long.: (centre) 52°34.985'N / 110°36.910'W [between NE end 52°35.005'N / 110°36.855'W and SW end 52°34.968'N / 110°36.961'W] [0.025'] [GPS]
UTM27: (centre) 12N 0526075E 5825400N [between NE end 12N 0526137E 5825282N and SW end 12N 0526010E 5825700N] [30m] [GPS]

collection: 020818b1 (2 replicates @ IDM ALTA / rhizome / leaf: full / inflorescence: full, 10 to 15 cm / flower: early to mature / fruit: young to mature)

photos: P9 (general habitat: drawdown lake offshore alkaline flats, note cattle grazing, pink flags mark plant boundary) P10 (detail habitat: drawdown lake offshore alkaline flats) P11 (habitat detail: drawdown lake offshore alkaline Juncus meadow, pink flags mark plant boundary) P12 (habitat detail: drawdown lake alkaline offshore openings in Juncus sward) P13 (general habitat: drawdown lake shoreline meadow, pink flags mark plant locations) P14 (habitat detail: drawdown lake shoreline meadow) P15 (general habitat: drawdown lake offshore Juncus sward, note grazed swaths, pink flags mark population) P16 (general habitat: drawdown lake offshore Juncus sward, pink flags marks plant location)

plant numbers: 65 000 plants in 50 m X 250 m area [estimate based on counts in several 10m X 10m areas]

note: associated with Aster pauciflorus (020818a) and Carex parryana (020818c); does not appear to extend onto the upland grassland above

the high lake level shoreline; does extend somewhat into the lake basin's offshore Juncus – Hordeum community; habitat 1 presents presence of Antennaria parvifolia and has grazed swaths in 20% of the surface area and grazing to 10% of height (i.e., 90% gone); habitat 4 extends 30 m into the sward, beyond this to 20 m to 30 m in the lake basin's Hordeum meadow zone where it has rather sporadic occurrence, almost an edge effect; fairly consistently evident in grazed swaths and openings in the Juncus – Scirpus swards, but not evident where this year's growth has not been grazed; does the grazing release the over-cover of Juncus, and the Muhlenbergia becomes more evident, or is this actually an increasing population?

habitat 1: drawdown lake shoreline and nearshore, level (3° E to SE slope) submesic (formerly subhygric) alkaline sand with grazed closed to semiclosed graminoid nearshore meadow of 5–20% **Muhlenbergia asperifolia** – LITTER – Antennaria parvifolia – SOIL (alkaline sand); 1–5% Potentilla anserina – Scirpus pungens – Juncus balticus – Sonchus uliginosus – Agropyron trachycaulum subsp. trachycaulum – Glaux maritima – Solidago canadensis var. canadensis – Carex parryana – Cirsium flodmanii – MOSS; <1% Aster ericoides – Potentilla pensylvanica – Poa pratensis var. pratensis – Aster pauciflorus – Symphoricarpos occidentalis – Koeleria macrantha – Agropyron trachycaulum subsp. subsecundum – Cirsium arvense – Cerastium arvense – Deschampsia caespitosa – Distichlis stricta – Rosa acicularis – Carex ?obtusata – Plantago major – Fragaria virginiana

habitat 2: drawdown lake nearshore sandy exposures open alkaline barrens with graminoid meadow of 20–50% SOIL (alkaline sand); 5–20% **Muhlenbergia asperifolia** – LITTER; 1–5% Scirpus pungens – Antennaria parvifolia – Glaux maritima – Aster pauciflorus – Aster ericoides – Sonchus arvensis – Distichlis stricta – Juncus balticus; <1% Carex parryana – Elymus trachycaulum subsp. trachycaulum – Cirsium flodmanii – Agropyron trachycaulum subsp. subsecundum – Potentilla anserina – Solidago canadensis

habitat 3: drawdown lake nearshore with extremely open alkaline barrens of >75% SOIL (alkaline sand); 5–20% Glaux maritima; 1–5% LITTER – **Muhlenbergia asperifolia** – Sonchus arvensis – Aster pauciflorus – Aster ericoides – Juncus balticus – Hordeum jubatum – Scirpus pungens – Ranunculus cymbalaria – Agropyron trachycaulum subsp. subsecundum – Potentilla anserina; <1% Puccinellia nuttalliana

habitat 4: drawdown lake offshore alkaline sand with grazed openings in Juncus balticus sward having semiclosed to closed graminoid meadow of 20–50% Juncus balticus; 5–20% LITTER – Glaux maritima; 1–5% SAND – **Muhlenbergia asperifolia** – Sonchus arvensis – Potentilla anserina; <1%

Deschampsia caespitosa – Ranunculus cymbalaria – Aster ericoides – Scirpus pungens – Aster pauciflorus – Carex pratericola

map/date site: Ma13 – Muhlasp-020818f

Carex crawei Dewey**—Crawe's sedge—*CYPERACEAE***

This low to medium height lowland sedge has a provincial Rank of **S2** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). It is a perennial graminoid, with well-developed rhizomes, and has persisting clusters of the previous year's leaf bases. It has a single terminal staminate spike that is well-separated from the two to three sessile pistillate spikes, and has leaf-like bracts along the stem. The perigynia are glabrous and have three stigmata that develop from green when young to beige with small reddish glandular dots on its surface when mature, with light reddish-brown hyaline scales. A first glance, the species resembles small plants of *Carex lanuginosa* or others of the Section *Hirtae*, except that the perigynia are glabrous, not densely if minutely hiruste. Contrary to the comparisons indicated in *Rare Vascular Plants of Alberta* (Kershaw *et al.* 2001), the specimens located during this survey did not at all bear any resemblance to *Carex aurea*, which is a much more delicate plant with orange globose perigynia. Its closest resemblance is to *Carex granularis* which extends from the east only as far as Saskatchewan, and rather has its staminate spike immediately proximate to the pistillate spikes.

This widespread Northern American species occurs in all the provinces except Nova Scotia and is rare in four other provinces, including Saskatchewan and New Brunswick, and possibly as an extirpated species in British Columbia and Newfoundland–Labrador. As well, it occurs in over two-thirds of the United States and is rare in 13 states, and extirpated from two states (NatureServe 2003, Kershaw *et al.* 2001). It has a very limited occurrence in Alberta with 13 known locations in the northern and central Rocky Mountain, northeastern Grassland and eastern Parkland Natural Regions (ANHIC 2003), with its nearest location less than 25 km from the study area, on the low border of Rough Lake, southeast of Wainwright, collected by K.E. Tannas in 1978 (ANHIC 2002, 2003; Moss 1983). Within the Wainwright Dunes Ecological Reserve, it was first reported by Cottonwood Consultants, Ltd. (1986) from the Great Fen basin and from the northwestern end of the large pond near it. In 1992, Derek Johnson and Patsy Cotterill, and again in 2001, Patsy Cotterill and Margaret Meijer reported five locations about 300 m north of the David Lake shore. During the present survey, however, it was found only once, unfortunately just 175 m east of the eastern boundary of the Reserve, again in the backshore zone along the north shore of David Lake. Searches in the previously reported locations or in potentially suitable habitats within the study area did not rediscover any additional individuals of this species.

The previous records of Cotterill and Meijer (2001) indicated that "hundreds" of plants of this species were located along the aspen grove on the north side of David Lake. However, searches during the 2002 survey did not rediscover any plants in the backshore grove or tall thicket habitats. However, the current study did discover a small population

from the northern backshore of David Lake, but just outside the Ecological Reserve's eastern boundary, with 13 plants occurring in a tight 0.4 m X 0.7 m cluster, and with most of the plants presenting a developing inflorescence that by early July had at least young fruits that were well on their way to maturing. Since the population was beyond the Reserve's formal study area, only a portion of the potential habitat could be surveyed; there is potential, however, for "hundreds" to occur at that location.

The habitat conditions for the species across the province generally appear to be "calcareous meadows" (Kershaw *et al.* 2001, Moss 1983). Within the Reserve they were reported to include a patterned fen in the "extensive beaverpond and fen complex" at the Great Fen, about 2 km northwest of David Lake, and from an "imperfectly drained edge of an aspen grove" near the lake's northern backshore (ANHIC 2002). The populations that were discovered during the 2002 survey occurred in a subhygric seepage backshore semiopen tall thicket of *Salix pseudomonticola, Betula occidentalis, Carex lanuginosa, Juncus balticus* and *Crepis runcinata* (scapose hawk's-beard), in association with other calcareous seepage habitat herb cover species of *Carex aurea* (golden sedge), *Carex viridula*, *Eleocharis quinqueflora*, *Primula incana*, *Senecio pauperculus*, *Deschampsia cespitosa*, and notably with the rare *Gentiana fremontii*.

Habitat threats to the plants occurring here may be related to the prolonged drought conditions between 2000 and 2002 around the wetlands and lake basin. It is apparent that the subsurface seepage flow along the northern backshore of David Lake has been reduced and what now are subhygric moisture regimes probably were in the past at least hygric in moisture climatic conditions. Prolonged drought may induce the invasion and establishment of a more closed shrub cover that may affect the plants. The Great Fen complex currently still has standing water, but evidently not as much as when the species was originally found here, and searches in 2002 did not rediscover the species there. In the case of the population occurring east of the reserve, a conversation with the local rancher, Hilson Maull, indicated that the entire thicket complex along the north shore of David Lake outside the Reserve boundaries was under forest cover to the mid 1990s, but was cut and brushed out to improve grazing capability. This activity must have influenced the present thicket community which is still relatively rich in fen species, including two rare plant species, Carex crawei and Gentiana fremontii. The cattle grazing pattern in the area outside the Reserve boundaries occurred as grazing corridors only a meter or so wide that meander through the community. As well, the cattle use the thicket as a movement corridor at this location, creating several well-worn, east to west trails, with only minor grazing along their immediate margins. Within the Reserve boundaries, no grazing was noted in the Great Fen area, but it was present at a light intensity in the thickets north of the lake.

Management concerns should include monitoring the recently discovered population and attempting to rediscover the previously reported populations, perhaps in moister

climatic conditions. It is likely that additional populations occur in suitable seepage and fen-like wetland situations not only along the northern end of the lake, but also along its southern and western sides. An investigation of the reported cutting of the backshore forest for grazing improvement should be undertaken to determine its extent and dates, and whether this activity has damaged or actually improved the habitat for this and the rare gentian species. Since the prolonged drawdown of the water table and lake level probably will advance the invasion of more mesic species into the habitats, any future monitoring should identify the extent of this potential impact.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Carex crawei* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type	frost (4)
Flood Hazard	none
Soil Drainage	imperfectly drained (5), poorly drained (6)
Perviousness	moderately (2)
Site: Macro	plain (7), valley floor (6)
Site: Meso	level (7)
Site: Micro	straight (1), hummocks (2)
Site: Surface Shape	straight (1)
Ecological Moisture Regime	subhygric (6), hygric (7)
Nutrients	?permesotrophic (4)
Successional Status: 1	young seral (2)
Successional Status: 2	not apply
Disturbance Factors	site improvement (7), water related (8), grazing (5)

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	mid-June
Phenology: reproductive – inflorescence	late June, early July
Phenology: reproductive – flower	early July
Phenology: reproductive – fruit	mid- to late July
Habitat Threats	thicket clearing, water table fluctuation, grazing
Management Considerations	monitor population, determine brushing impact

Carex houghtoniana Torr. *ex* Dewey**—sand sedge—*CYPERACEAE***

This upland sedge of dry sandy and gravelly acid sites, gravel pits and open forest habitats has a provincial Rank of **S2** in Alberta and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). It is a medium-sized perennial erect sedge that spreads by rhizomes, and that has stiff leaves and culm. It has one to several staminate spikes that are well-separated from the two pistillate spikes, with notably hairy perigynia that are 5 to 7 mm long. This species is similar to the other two members of the Section *Hirtae* occurring in Alberta, *Carex lanuginosa* and *Carex lasiocarpa*, except that its perigynia are longer (rather than from only 2 to 5mm long in the above), have distinct, coarse, rib-like veins on its surface (rather than relatively less protrusive veins), have perigynial scales that are notably acute to awned (rather than merely acute), and are shorter than the perigynia (rather than about as long). The foliage tends to be somewhat yellowish green (rather than green to occasionally bluish green), and invariably itis a species of dry, coarsely textured substrate (rather than wetland sites). Additionally, its notably pubescent perigynia separate it from another rare, wetland species, *Carex crawei*, that also occurs in the Ecological Reserve and has a similar but smaller growth habit.

This species occurs across Canada eastward of the Rocky Mountains, and also is rare in Newfoundland and three states (NatureServe 2003, Kershaw *et al.* 2001). In Alberta it has 11 known locations with concentrations in the lower elevations of the Rocky Mountain Natural Region west of Edmonton, with isolated locations near Fort McMurray and on the Canadian Shield (ANHIC 2003). It was not mapped from the Parkland Natural Region in the ANHIC (2002) data base, nor in *Rare Vascular Plants of Alberta* (Kershaw *et al.* 2001). However, the significant features map in Cottonwood Consultants, Ltd. (1986) indicated that the species occurred within the northwestern portion of the Ecological Reserve about 3 km northwest of David Lake (52°36.950'N / 110°39.790'W). C. Wallis (2002) confirmed that this was his record and that he was confident of the record, and further, he thought that he had made a collection that may be at the University of Alberta herbarium. No specimen was found at the provincial parks herbarium. The potential habitats in the general location of his record were surveyed during the 2002 project, but in only one instance was the plant thought to be found, although formal determination of the vouching specimen realized that this population actually was *Carex lanuginosa* occurring in an extremely unusual upland situation.

The typical habitat for this species is a variety of dry upland situations, including gravel pits, sandy & gravelly acid sites, and open forests. Wallis' record had the species occurring in an active sand dune blowout with light grazing, but no specifics of the habitat or population were available. The active blowout site where the *Carex lasiocarpa* population was located during the current survey was an otherwise typical, very dry blowout of extremely open sand with *Calamovilfa longifolia, Carex pensylvanica*

var. *digyna, Prunus virginiana* and the rare *Shinneroseris rostrata* and *Cyperus schweinitzii*.

The habitat threats to this species in a blowout situation would be erosion or drifting sand, and the source report (ANHIC 2002) indicated that grazing may have a minor impact. However, the potential locations examined did not present serious impacts from either of these disturbances.

The management considerations for this species would be to confirm the existence of this species within the Ecological Reserve, either through finding and confirming any specimens, or refinding the actual population. In the interim, some measure of access control to the area may be required since signs of ATV trails were in the immediate vicinity. Otherwise the location is remote enough to have had very little human or cattle visitation in the past decade.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Carex houghtoniana* in the Wainwright Dunes Ecological Reserve

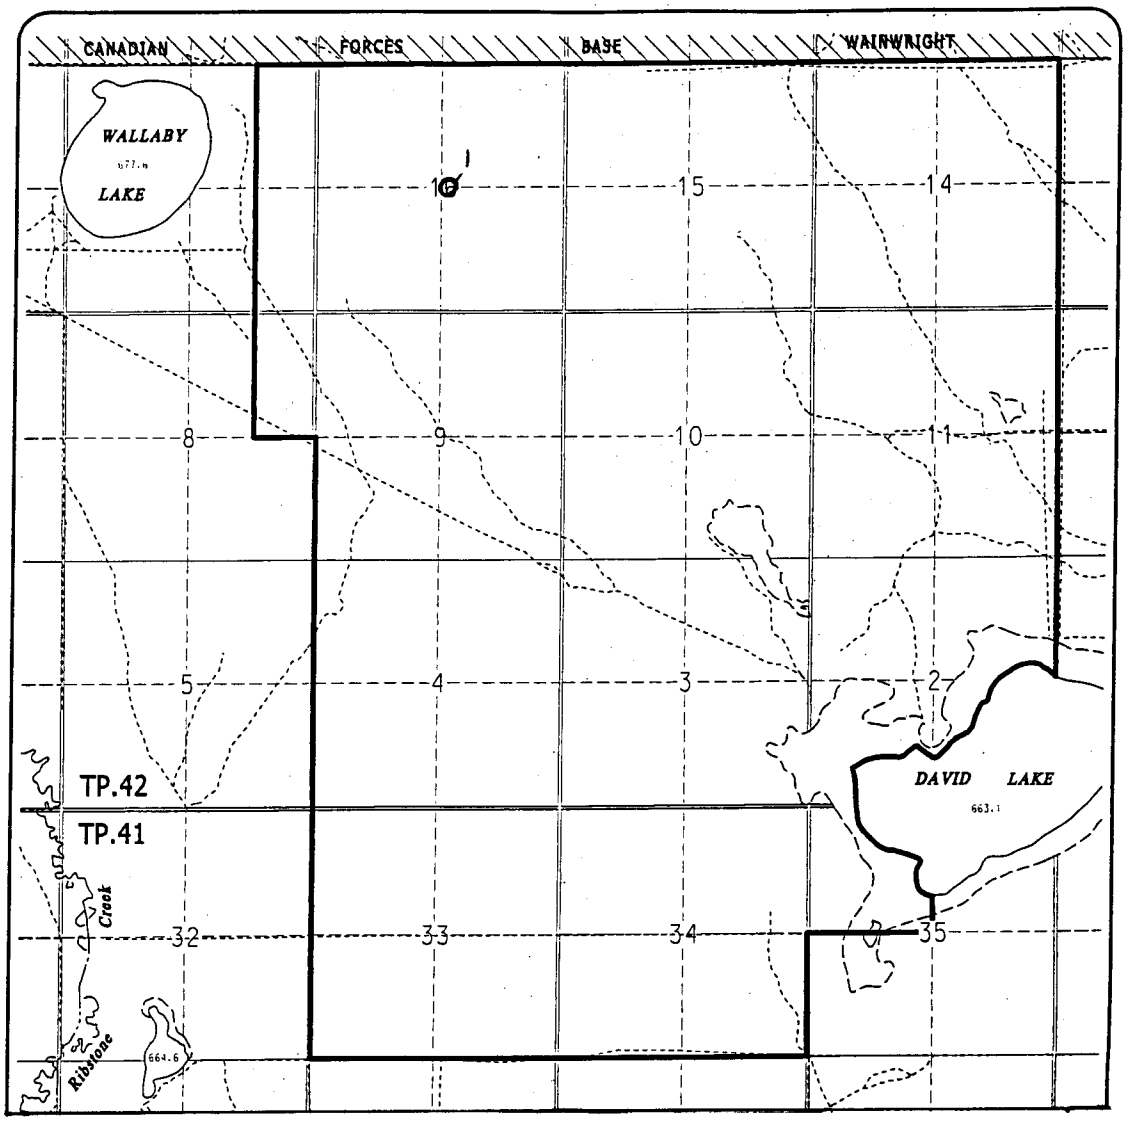
ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type	wind (2), insulation (3)
Flood Hazard	none
Soil Drainage	well drained (3), rapidly drained (2)
Perviousness	rapidly (3)
Site: Macro	plain (7)
Site: Meso	?midslope (3)
Site: Micro	straight (1)
Site: Surface Shape	concave (2)
Ecological Moisture Regime	xerix (2), very xerix (1), subxeric (3)
Nutrients	?submesotrophic (2)
Successional Status: 1	pioneer (1)
Successional Status: 2	not apply
Disturbance Factors	not apply

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	no information
Phenology: reproductive – inflorescence	no information (?June to July?)
Phenology: reproductive – flower	no information (?June to July?)
Phenology: reproductive – fruit	no information (?July to August)
Habitat Threats	blowout erosion
Management Considerations	finding & monitoring populations, limiting access

Species location summary for *Carex houghtoniana* in the Wainwright Dunes Ecological Reserve

map site / date site	location coordinates	number (size)	habitat
Ch1 – Carehou-86xxxxa	NW7–16–2–5W4	no information	active blowout – lightly grazed

Map: Species locations for *Carex houghtoniana* in the Wainwright Dunes Ecological Reserve (o indicates approximate reported location)



PREVIOUSLY REPORTED SPECIES LOCATIONS

map/date site:	**Ch1 – Carehou-84xxxxa**
location:	Wainwright Dunes Ecological Reserve // NW7–16–2–5W4 // about 52°36.950'N / 110°39.790'W
source:	Cottonwood Consultants, Ltd. (1986); C. Wallis (pers. com. – I.D. Macdonald)
reference:	Cottonwood Consultants, Ltd. 1986. The Proposed Wainwright Ecological Ecological Reserve—A Biophysical Overview. Alberta Recreation and Parks, Edmonton.
observation:	C. Wallis 1985
collection:	no information (possibly at ALTA?)
photo:	none
plant numbers:	no information
note:	[Wallis indicated that he had confidence in this record, and thought that he did make a vouching collection, possibly at the University of Alberta herbarium]
habitat:	active blowout – lightly grazed
comment:	The Significant Features map in Cottonwood Consultants, Ltd. (1986) indicated the species at this location in the northwestern portion of the ecological reserve, about 3 km northwest of David Lake. It was surveyed in 2002 (see below), but no plants were discovered. A potential collection from the dune complex at 52°36.975'N / 110°36.785'W, in the immediate vicinity of the indicated location, proved to be Carex lanuginosa (Macdonald 020716g1 – PP#4890) in an extremely open, very dry blowout habitat of 50–75% SAND; 5–20% LITTER; 1–5% Carex lanuginosa – Calamovilfa longifolia – Cyperus schweinitzii; <1% Carex pensylvanica var. digyna – Shinneroseris rostrata (see 020716h) – Prunus virginiana. This site also held two rare species, Shinneroseris rostrata (020716h) and Cyperus schweinitzii (020716f); there is a slight chance that Wallis' entry for this sedge species may actually have been a transcription error for "Cyperus houghtonii", an erect species that resembles the Alberta rare species Cyperus schweinitzii, that is in this habitat.

(none)

Carex parryana Dewey **var. *parryana*—Parry's sedge—*CYPERACEAE***

This perennial semicespitose sedge of moist open meadows, swales and other lowland habitats has a provincial Rank of **S1S2** in Alberta, and a global Rank of **G4T4** (Vujnovic & Gould 2002, ANHIC 2002). The plant has stiff basal leaves that rise in loose tufts with reddish-tinted bases from a rhizome. There is an erect, obtusely triangular culm that is topped by a tight, narrow inflorescence of stiffly ascending terminal and lateral spikelets, with small perigynia and short staminate spikelets that are crowded at the base of the terminal spike, and a very short, sheathless bract at the base of the bottom spikelet. There is only one sedge species in the ecological reserve that shares its habitats and initially could be confused with this distinctive species, *Carex scirpoidea*. While this sedge also has stiffly erect culms and basal leaves, it differs in having pubescent perigynia in a single, densely fruited, cylindrical spikelet (Moss 1983).

This species occurs in the northwestern quarter of North America, and also is rare in Ontario, and in Wyoming (NatureServe 2003). In Alberta it has 24 wide-spread known locations in the central Rocky Mountain, Parkland and Grassland Natural Regions, with several known populations in alkaline and salty springs and shore sites occurring within 30 km of the Ecological Reserve (ANHIC 2003, Kershaw *et al.* 2001). There were four previous records within the Reserve from the northern shore and vicinity of the peninsula of David Lake, originally recorded by Fehr (1984), Cottonwood Consultants, Ltd (1986) (although not mapped by them), Wallis (1990) and Meijer (2001). The survey in 2002 discovered an additional nine records from within the Reserve around the David Lake basin, with the greatest known concentrations around the southern and southwestern end of the David Lake peninsula, the eastern side of the peninsula's base, and the bay on the lake basin's western side. Additionally, several smaller scattered species locations were recorded on the general grassland in the inland body of the peninsula, in the hummocky seepage meadows and in the lake basin's northern backshore. As well, an additional four new records were discovered from the eastern side of the basin, but outside of the Reserve's boundaries, with the probability that similar populations also extend along the southeastern side of the basin's offshore.

The numbers for this species within the general vicinity of David Lake totaled 23 646 individuals, as based on actual counts of culms and basal leaf clusters. Even recognizing that with its rhizomatous character, each individual plant of this species may produce several such clusters, the population still is notable for the province. And, it is likely that many more individuals also occurred elsewhere around the periphery of the lake basin. Within the Ecological Reserve boundaries there were 12 621 individuals counted in 13 sampled sites, and outside the boundaries there were 11 025 individuals in four sampled sites. The number of plants at the sites varied from about 20 to over 10 000 individuals in areas from 4 m X 5 m, to over 100 m X 100 m. As well, along the peninsula's eastern side

they occurred as a zone 35 m wide and 200 m along the offshore that encompassed 17 widely spaced concentrations with 355 individuals. In 2002, the populations within the reserve were setting leaves and very young inflorescence buds by mid-June, with the inflorescences in full development and in flower by mid- to late June to early July, and with fruit development proceeding from mid- to late June through to mid- or late July.

The inventory of saline wetlands and spring habitats by Wallis (1990) described this species as being a "facultative wetland species, [occurring] in springs" with no other comment in his summarizing species list; however, he also indicated that "[*Carex parryana*] occurs occasionally on hummocks ... and ... most forbs in this wettest portion of the springs [i.e., wet spring meadows] also occur on hummocks" (page 14), and that it occurred "at Dune Point Springs' saline springs with an open drier area of *Distichlis stricta, Puccinellia nuttalliana* ... with *Aster parviflorus*" (page 41). In the Reserve, the largest concentrations of the species around the David Lake basin occurred in the nearshore and offshore drawdown alkaline meadows which are essentially level, and in the hummocky terrain that was created by cattle trampling and grazing patterns. Due to the drought conditions at the time of the 2002 survey, both of these formerly hygric to subhydric habitat situations were mesic to subhygric at best. The community associated with the species was a semiclosed to semiopen graminoid meadow of *Distichlis stricta*, *Calamagrostis stricta*, *Carex praegracilis* (graceful sedge), *Deschampsia cespitosa*, *Agropyron trachycaulum*, *Juncus balticus*, *Antennaria parvifolia*, *Potentilla anserina* and others, and it was associated with the rare *Aster pauciflorus* and *Muhlenbergia asperifolia*. This habitat usually extended some 50 to 100 m offshore, but not into the increasing concentration of *Hordeum jubatum* cover that continued as the dominant cover further out into the basin. Backshore and nearshore habitats on the northern and western sides of the lake basin supported rather richer, more closed meadow communities, often with several calcareous seepage associated species that occurred, at least as traces. Typical of these communities were *Deschampsia cespitosa*, *Calamagrostis stricta*, *Juncus balticus*, *Agropyron trachycaulum*, *Glaux maritima*, *Sonchus uliginosus*, *Dodecatheon pulchellum*, *Primula incana*, *Crepis runcinata* and others. Back from the lake basin near the base of the peninsula were several strongly-developed hummocky meadow sites which supported local and small populations of the sedge. These had closed, tight carpets of *Antennaria parvifolia*, *Carex stenophylla* var. *eleocharis* (low sedge), *Carex scirpoidea*, *Deschampsia cespitosa*, *Juncus balticus* and others, and may well also have been a habitat for the rare *Gentiana fremontii*. This habitat apparently occurred on calcareous seepage slopes that normally were hygric, although they were virtually submesic during the 2002 drought conditions. The hummocks themselves appeared to have been created by the trampling of cattle moving through the sites in the wetter conditions, although little grazing was evident during the 2002 survey. These habitats currently supported only very sparse groups of the sedge, but they have potential to have more away from the lakeshore in moister times.

Any habitat threats to the recent plant locations in the lake basin and backshore sites must be related to the prolonged regional drought conditions. The drawdown conditions of the lake level undoubtedly has extended the potential habitat for the species considerably around the David Lake basin. This habitat supported over 85% of the reserve's population, while during moister climatic conditions the plants probably would be limited to the more narrow shoreline zones around the lake. On the other hand, wetter conditions would revitalize the populations in the seepage slope hummocky meadows which occurred in at least eight depressions in the gently rolling sandland back from the basin's northwestern side. Grazing by cattle did not appear to present a significant impact on the plant locations; the coarseness of the leaves and culms did not appear to be favored over the relatively more palatable grasses in the same habitat.

Management concerns for the species at this time should include monitoring the populations around the David Lake basin and in the hummocky seepage slope meadows, particularly concerning the long term impacts of the prolonged drought conditions on the foliage and seed production. As noted above, grazing by the resident cattle did not appear to present a problem for the populations here, although such pressures should also be monitored.

Cyperus schweinitzii Torr.**—sand nut-grass—CYPERACEAE**

This distinctive perennial graminoid of dry sand, active sand dune sites has a provincial Rank of **S2** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). It has a rhizome that produces corm-like thickenings at its tip, with narrow, scabrous, 2 to 10 cm long basal and lower culm leaves. The culms are scabrous and triangular and are 10 to 70 cm tall, with several leafy bracts at its top, and several inflorescences on subsessile to 10 cm long branches. Each inflorescence tipped with a dense cluster of 1 cm long spikelets that have alternately-arranged, acuminate, brownish scales and small, hard, brown achenes. There literally is no other medium-height plant in Alberta that resembles this species, except perhaps for certain members of the genus *Scirpus*, which have a round to oval-shaped spikelet arrangement rather than the regimented planar array of alternate florets that are evident in the genus *Cyperus*. Its nearest relative is a more eastern species, *Cyperus houghtonii* that does not enter Alberta, and which has a slightly smaller growth habit, obtusely angled, smooth culms, smooth leaves, and obtuse scales. In its vegetative state it initially may be mistaken for *Carex pensylvanica*, but that species differs in having very fibrillose rhizomes. In the early summer, the plants of this species may readily be recognized by the accumulation of the previous several years' old culms and inflorescences that form a greying carpet of detritus at the plant bases, creating a somewhat dingy aspect to the lower slopes and bases of the sand dune blowouts. The drought conditions did not appear to greatly affect the growth of this species during the 2002 survey of the Reserve, understandably, since it is a very dry habitat species. This plant often occurred in a general association with the rare *Shinneroseris rostrata*, and perhaps also with *Carex houghtoniana* and *Chenopodium leptophyllum*.

This species occurs in seven provinces from Alberta to Quebec and in 29 states from New England to Texas and the central and mid-western states. It also is rare in Manitoba and Saskatchewan and in eight states including Montana (NatureServe 2003). It occurs in southeastern Alberta with 14 very isolated known locations in the Grassland and Parkland Natural Regions (Kershaw *et al.* 2001, ANHIC 2003). The location at Wainwright Dunes Ecological Reserve appears to have the only known concentration in the eastern Parkland (Kershaw *et al.* 2001). The species was previously recorded from here by Fehr (1984), Cottonwood Consulting, Ltd. (1986) and Derek Johnston (1992) who together discovered ten locations, with all but one from within the Reserve boundaries. The 2002 survey rediscovered two of these general locations, and added an additional three general clusters with an additional 16 species locations. These were all associated with the eroded dune ridge landforms and were located as clusters about 2 km west of David Lake, 800 m, 2 km, 2.5 km and 3 km northwest of the lake, 2 km north northwest, and 1 km and 2 km north of the lake.

The number of plants of this species that were counted in 2002 within the Ecological

Reserve's boundaries totaled 9 123 plants in the four clusters of 15 sites that were sampled. The number of plants the varied from 35 to over 3 000 individual basal leaf clusters with associated culms with inflorescences in areas of from 3 m X 7 m, to 30 m X 85 m. Unfortunately, none of the previous records for the species included population information, except the indications of "very rare". In most cases, the leaf clusters were in fact connected by rhizomes, with at least five per rhizome, and these plants formed a semiopen to semiclosed, low graminoid cover on the blowout sand habitat. In 2002, the plants started to develop leaves in late May to early June, and the leaves were at least half developed by mid-June, and fully developed by mid-July. The culm started to develop by mid-June, and was fully extended by mid-July, and the inflorescence probably was initiated by late June and was mature by mid- to late July. The flowering phase appeared to initiate in early July and continued through mid-July to essentially end by late July. Submature fruits were present by the third week in July and mature fruits were prevalent by mid- to late August. In only one location did the entire group of plants not produce any inflorescences; in all the rest at least 50% to 70% of the plants were fertile. As indicated above, the bases of the sandy blowout slopes had notable accumulations of the old inflorescences, and presumably fruits, from the previous years. With the additional moisture and litter, these conditions may provide an opportunity for successful seed germination and seedling survival success.

The sole habitat that this species occupied within the Reserve was the xeric to subxeric, semiactive, semiopen to open sand in the middle to lower slopes of the erosion faces on the southwestern-facing sides of the sand dune ridges. The populations often formed a semiopen cover in association with other dune habitat species, notably *Calamovilfa longifolia, Carex pensylvanica* var. *digyna, Koeleria macrantha, Carex obtusata, Carex siccata, Festuca saximontana, Stipa curtiseta, Helianthus couplandii, Heterotheca villosa, Artemisia campestris*, the moss *Tortula ruralis* and others, including the provincially rare *Shinneroseris rostrata* and *Chenopodium leptophyllum*, and possibly also *Carex houghtoniana*. The lower slope and the ridge slope draw habitats tended to have a somewhat denser concentration of plants and appeared to initiate their growth earlier in the season; this may have been due to increased soil moisture along the slope base zone. It was not until the mid-summer survey period that plants were noted along the mid- to lower slopes, although by then these often appeared to have formed semiopen to semiclosed covers at the same phenological development stage as at the slope bases. The blowout basins tended to have relatively closed meadows of the *Calamovilfa longifolia, Koeleria macrantha*, and other associated species, including often very closed carpets of *Hudsonia tomentosa* and several species of lichen, notably *Cladonia mitis, Cetraria ericetorum, Caldonia uncialis, Cornicularia aculeata* and others. However, the population of the *Cyperus* appeared to avoid extending into these more stablized, closed carpets and meadows.

There were no immediate habitat threats to the populations in the reserve. Associated

with the sand dune ridge blowout situations were wind-caused erosion and deposition, although only two groups of the species were developed on actively depositing sand and appeared to be maintaining their growth, and no populations appeared to be seriously eroding. Nevertheless, at one location there were signs of recent unauthorized all terrain vehicle ("quad") use in the blowouts, and this may impose an occasional local threat. Additionally, one very local population (Cs26) was not producing any fruits in 2002, although, judging from the previous year's accumulation of productive culms and inflorescences, there was normal production in 2001; this may indicate a failing population, but the situation was by no means typical of anywhere else in the Reserve.

Management considerations for maintaining the species in the reserve at this time should include monitoring the size and vigor at the known plant locations. As well, a further survey should include the discovery of additional locations for the plants, since probably only about half of the blowouts in the Ecological Reserve could be examined during the 2002 survey. Measures should be taken to discourage unauthorized off-road vehicle use in the area, particularly in the vicinity of active sand sites.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Cyperus schweinitzii* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION

Exposure Type	wind (2), insulation (3)
Flood Hazard	not apply
Soil Drainage	rapidly drained (2), well-drained (3)
Perviousness	rapidly (1)
Site: Macro	not apply
Site: Meso	mid-slope (3), lower slope (4), toe (5)
Site: Micro	straight (1)
Site: Surface Shape	concave (2)
Ecological Moisture Regime	very xeric (1), xeric (2), subxeric (3)
Nutrients	?submesotrophic (2)
Successional Status: 1	pioneer (1)
Successional Status: 2	not apply
Disturbance Factors	not apply

ANHIC RARE NATIVE PLANT REPORT

Phenology: vegetative	late June to mid-July
Phenology: reproductive – inflorescence	late June to mid July
Phenology: reproductive – flower	early to mid- to late July
Phenology: reproductive – fruit	mid- to late July, and early to mid-August
Habitat Threats	wind erosion and drifting, recreation
Management Considerations	monitoring populations and drought impacts

Species location summary for *Cyperus schweinitzii* in the Wainwright Dunes Ecological Reserve (+ indicates site outside reserve boundary)

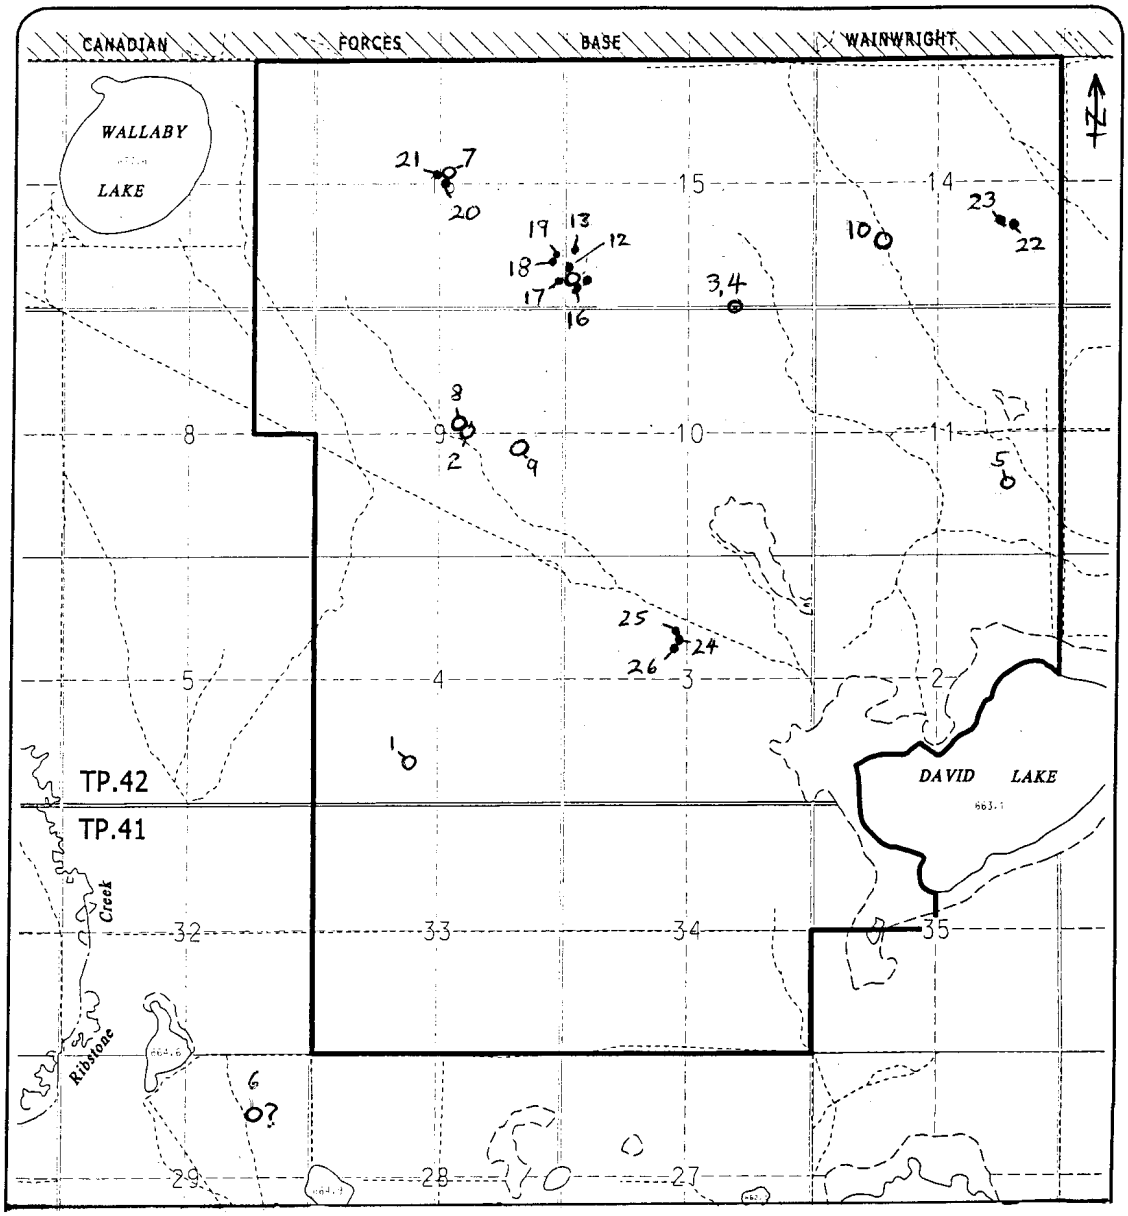
Map: Species locations for *Cyperus schweinitzii* in the Wainwright Dunes Ecological Reserve (o indicates approximate reported location)



PREVIOUSLY REPORTED SPECIES LOCATIONS

map/date site: Cs1 – Cypesch-830623a

location: Wainwright Dunes Ecological Reserve // David Lake // UTM27 522600E 5825600N // lat./long.: 52°35'N / 110°40'W // see map Cs1 // see comment

source: ANHIC // Element Occurrence PMCYP06360 # 004

reference: Fehr, A. 1984. Wainwright Study Area: A Biophysical Inventory. Alberta Energy and Natural Resources

observation: Fehr, A. 23 June 1983

collection: 1983-06-23 // Fehr, A. & S. Charbonneau // PM#B86.17.75 // ID-OK // specimen source code S83FEHPMABCA010

photo: none

plant numbers: no information

note: remains of last year's plants (includes panicle)

habitat: "active sandy blowout" // elev. 645m approx. 35m

comment: this location is 3.3 km W of the David Lake peninsula's southern tip

map/date site: Cs2 – Cypesch-830623b

location: northwest of Wainwright Dunes Ecological Reserve boundaries // Wallaby Lake // UTM27 523000E 5827750N // see map Cs2 // see comment

source: ANHIC // Element Occurrence PMCYP06360 # 005

reference: Fehr, A. 1984. Wainwright Study Area: A Biophysical Inventory. Alberta Energy and Natural Resources source code R84FEH01ABCA

observation: Fehr's vegetation plot AF83017

collection: 1983-06-23 // Fehr, A. & S. Charbonneau s.n. // PP#619 // K. E. Tannas // vidi & stet IDM–02 // specimen source code S83FEHPPABCA06

photo: none

plant numbers: very rare

note: none

habitat: "active blowout – dry sandy soil" // 685 m // see comment

comment: not actually within Wainwright Dunes Ecological Reserve boundaries; specimen examined at Provincial Parks herbarium indicate that this collections from "stand 17 – active blowout"; specimen says "David Lake", but does not indicate Wallaby Lake; specimen presents the previous year's vigorous clum and inflorescence and present year's culm and inflorescence at subanthesis at 60% formed inflorescence; habitat is given as "very dry sandy soil"

interpretation of Fehr 1984 vegetation plot data for Study Area ID 017: location in Wainwright Dunes Ecological Reserve; ca 3.6 km NW of David Lake peninsula's southern tip; UTM27 522900 5827780 [50 m] [map]; 7–9–

42–5W4
population is rare, here it is infrequent
habitat is sand dune blowout (pitted valley floor) with very xeric mineral soil supporting barrens meadow of LOW SHRUB: (1% – extremely open) Prunus virginiana (1%); HERB: (30% – semiopen) SOIL (mineral) (90%) – Calamovilfa longifolia (10%) – **Cyperus schweinitzii** (10%) – SOIL (humus (5%) – Koeleria macrantha (5%) – Elymus canadensis (5%) – LITTER (3%) – Oryzopsis hymenoides (3%) – Artemisia campestris (1%) – Festuca saximontana (1%) – Erysimum inconspicuum (0.5%) – Potentilla (species) (0.5%) – Heterotheca villosa (0.5%) – Carex obtusata (0.1%)

map/date site: Cs3 – Cypesch-830717a

location: Wainwright Dunes Ecological Reserve // David Lake area // UTM27 524600E 5828550N // see map Cs3 // see comment
source: ANHIC // element Occurrence PMCYP06360 # 006
reference: Fehr, A. 1984. Wainwright Study Area: A Biophysical Inventory. Alberta Energy and Renewable Resources // document source code R84FEH01ABCA
observation: Fehr's vegetation plot AF83007
collection: 1983-07-17 // Fehr, A. // PP#660 // ID-??
photo: none
plant numbers: no information
note: —
habitat: blowout in grassland // 678 m
comment: specimen not located at the Alberta Provincial Parks herbarium; the ANHIC data base location UTM27 is situated in a wetland basin, 3 km NNW of the David Lake peninsula's southern tip

map/date site: Cs4 – Cypesch-830717b

location: Wainwright Dunes Ecological Reserve // David Lake area // UTM27 524600E 5828550W // see map Cs4 // see comment
source: ANHIC // Element Occurrence PMCYP06360 # 006
reference: Fehr, A. 1984. Wainwright Study Area: A Biophysical Inventory. Alberta Energy and Renewable Resources. // document source code R84FEH01ABCA
observation: vegetation plot AF83007
collection: 1983-07-17 // Fehr, A. // PP#620 // det: T.E. Tannas // vidi & stet IDM–02
photo: none
plant numbers: no information except for "rare"
note: —
habitat: blowout in grassland; rare, dry sand soil and dunes // 678 m

comment: specimen located at the Alberta Provincial Park herbarium indicated this from vegetation site 07, but Fehr 84 reference not indicated Cyperus from the community sample data; specimen label indicates SE9–42–5W4; specimen indicates inflorescence with mid- to late flowers and submature fruits; this location is 3.3 km W of the David Lake peninsula's southern tip

map/date site: Cs5 – Cypesch-830726a

location: Wainwright Dunes Ecological Reserve // David Lake // UTM27 526400E 5827450N // see map Cs5 // see comment
source: ANHIC // Element Occurrence PMCYP06360 # 001

RECENTLY DISCOVERED SPECIES LOCATIONS

map/date site: Cs12 – Cypesch-020616c
location: Wainwright Dunes Ecological Reserve; 3.6 km NW of David Lake peninsula's southern tip; NW4–15–42–5W4; see figure and map Cs12

lat./long.: (centre) 52º36.651'N / 110º39.094'W [0.025'] [GPS]

collection: 020616a5 (1 voucher @ PP / young plant / root / rhizome / bulb / leaf: 1/3 developed, 14–18 cm / inflorescence: not yet developed / old inflorescence & fruit: 15-30 cm)

photos: B18 (general habitat: sand dune blowout slope, looking NW) B20 (general habitat: sand dune blowout slope, looking SE, scale to backpack, blue flags mark plants) B21(general habitat: sand dune blowout slope base, dark tone at base is previous years' dead inflorescences, blue flags mark individual plants) B22 (habitat detail: young foliage and previous years' dead inflorescences at sand dune blowout slope base, scale to pen) C18 (habitat detail: base of sand dune blowout slope, note green foliage concentration) C19 (habitat detail: sand dune blowout slope, plants extend from base of dune ridge blowout to about half to 2/3 up toward crest)

plant numbers: 1 210 plants counted in 20 m X 45 m area with 2 groups of 23 clusters (SE basin: 1050 plants counted in 17 m X 35 m, NW basin: 160 plants counted in 5 m X 10 m); this is the count of the 2001 population from old inflorescences; (see figure)

note: slope base has <30% cover, mid-slope has <10% cover; the current year's plant growth has foliage with yellow-green, narrow leaves, surrounded by a dense mat of the previous years' culms at their bases, giving the site a dingy grey appearance

habitat: sand dune ridge south-facing blowout erosion slope with sand barrens of 75–50% SOIL (sand); 20–50% LICHEN; 5–20% Calamovilfa latifolia; 1–5% Festuca saximontana – **Cyperus schweinitzii** – MOSS; <1% Carex ?siccata – Koeleria macrantha map/date site: Cs13 – Cypesch-020616d

location: Wainwright Dunes Ecological Reserve; 3.6 km NW of David Lake peninsula's southern tip; NW4–15–42–5W4; see figure and map Cs13 lat./long.: (centre) 52º36.742'N / 110º39.062'W [0.025'] [GPS]

collection: none

photo: B23 (plant population: in sand dune blowout, note grey strip at base of slope is the Cyperus schweinitzii's dead culm accumulations from previous years, scale to backpack)

plant numbers: 620 plants counted in 12 m X 30 m area; plants at base and lower half and basin of blowout

note: none

habitat: sand dune ridge semiactive blowout erosion slope (3º—35º toward 230º – SSW) with open xeric sand barrens of 75–50% SOIL (sand); 50–75% Sporobolus cryptandrus; 5–20% Calamovilfa longifolia – **Cyperus schweinitzii**; 1–5% Carex (species) – Rumex venosus – LICHEN; <1%

Houstonia tomentosa – Festuca saximontana – Oryzopsis hymenoides

map/date site: Cs14 – Cypesch-020616e

location: Wainwright Dunes Ecological Reserve; 3.6 km NW of David Lake peninsula's southern tip; NW4–15–42–5W4; see figure and map Cs14 lat./long.: (centre) 52°36.885'N / 110°39.288'W [0.025'] [GPS]

collection: 020616a6 (1 replicate (specimen missing?) / young plants / root / bulb / rhizome / leaf: submature, 20 cm / culm: young, 15 cm / inflorescence: 1/3 developed / flower: young / with old 2001 inflorescence and fruit)

photos: B24 (general habitat: sand dune blowout slope, population along mid- to lower slope) B25 (general habitat: sand dune blowout slope, SE end, blue flags mark population along mid- to lower slope) C20 C21 (plant detail: plant in situ, note previous year's culm and inflorescence, scale to pen)

plant numbers: 53 plants counted in 8 m X 40 m area; population at base and lower third of blowout erosion face; this is 2001 individual plant count based on previous year's dead culms; plants have new leaves 10 cm long over previous year's dead culms

note: none

habitat: sand dune ridge semiactive erosion slope (15° toward 260° – WWSW) (blowout basin semistabilized by Hudsonia tomentosa) with semiopen xeric sand barrens of 75–50% SAND; 50–75% Calamovilfa longifolia; 5–20% Koeleria macrantha; 1–5% **Cyperus schweinitzii** – Festuca saximontana – MOSS; <1% LICHEN – Hudsonia tomentosa – Juniperus horizontalis – Poa sandbergii – Carex pensylvanica

map/date site: Cs15 – Cypesch-020714f

location: Wainwright Dunes Ecological Reserve; NW km 3.5 of David Lake peninsula's southern tip; SW4–15–42–5W4; see figure and map Cs15 lat./long.: (centre) 52°36.729'N / 110°38.998'W [0.025'] [GPS]

collection: 020714f1 (2 replicates: UAC & ALTA / root / bulb / leaf: submidgrowth to mature, 15–30 cm / culm: 25 cm / bract: 9 cm / flower: submature to mature / old 2001 inflorescence and fruits)

photos: F18 F19 (general habitat: sand dune blowout slope base, pink flags mark plant boundary) E23 E24 E25 (detail of plants detail: plant growth habit with young inflorescences)

plant numbers: 192 plants counted in 30 m X 50 m area in three groups: 48 in 5 m X 9 m area at base of blowout system, 109 in 25 m X 25 m area in northeastern half of blowout basin, and 35 in 5 m X 10 m area in southeastern half of blowout basin

note: plant has the general appearance of Carex pensylvanica but is not as yellow-green toned; Hudsonia tomentosa concentrated at the base of

the slope, but the Cyperus schweinitzii seems to avoid establishing in it

habitat: sand dune ridge blowout semiactive erosion slope with open to very open active to semiactive sand barrens of 75–50% SOIL (sand); 1–5% Calamovilfa longifolia – Carex pensylvanica var. digyna – Carex obtusata; <1% **Cyperus schweinitzii** – Cetraria ericetorum – Festuca saximontana – Koeleria macrantha – Rosa acicularis – Heterotheca villosa – Hudsonia tomentosa – Chamaerhodos erectum – Juniperus horizontalis

map/date site: Cs16 – Cypesch-020715c

location: Wainwright Dunes Ecological Reserve; 3.5 km NW of David Lake peninsula's southern tip; SW4–15–42–5W4; see figure and map Cs16
lat./long.: (centre) 52°36.600'N / 110°39.050'W [west population at 52°36.590'N / 110°39.045'W, east population at 52°36.612'N / 110°39.058'W] [0.025'] [GPS]

collection: 020715c1 (1 replicate @ ALTA / root / rhizome / bulb / leaf: submature, 23 cm / culm: submature, 20 cm / inflorescence: mature / flower: submature to mature)

photos: (see also photos for Shinneroseris rostrata); F23 (habitat : sand dune blowout slope, NW end of the blowout, pink flags mark plant boundary) F24 (general habitat: semistable sand dune blowout, pink flags mark plants on SE end of blowout) F25 G1 (habitat detail; semistable sand dune blowout, scale to ruler) H0 H4 (plant detail: mature inflorescence, mid-flowering to young fruit development) H1 H2 H3 (plant detail: growth habit)

plant numbers: 314 plants in 25 m X 65 m area in two groups: 122 plants (20 in current inflorescence) in 8 m X 12 m area in the blowout's southeastern half, and 192 (25 in current inflorescence) in 10 m X 26 m area in the blowout's northwestern half; population extends from near blowout base to two thirds up the slope; marking flag on aspen at the central southwestern part of the blowout basin

note: associated with Shinneroseris rostrata (020715d)

habitat: sand dune ridge blowout semistable erosion slope (semistabilized by Calamovilfa longifolia) with semiopen to open sand barrens of 50–75% SOIL (sand); 5–20% LITTER – Koeleria macrantha – Calamovilfa longifolia – Stipa curtiseta; 1–5% **Cyperus schweinitzii** – Carex pensylvanica var. digyna; <1% Helianthus couplandii - Elymus canadensis – Carex obtusata – Poa sandbergii – Cetraria ericetorum – LICHEN – Oryzopsis hyemalis

map/date site: Cs17 – Cypesch-020716b

location: Wainwright Dunes Ecological Reserve; 3.6 km NW of David Lake

peninsula's southern tip; SE1–16–42–5W4; see figure and map Cs17
lat./long.: (centre) 52°36.617'N / 110°39.082'W [0.025'] [GPS]

collections: 020716b1 (upper slope plant / 1 replicate @ PP-4867 / root / rhizome / bulb / leaf: submature to mature, 20 cm / culm: submature, 20 cm / inflorescence: young to full mature / flower: young to submature to mature); 020716b2 (lower slope plant / 1 replicate @ ALTA / root / rhizome / bulb / leaf: young, 17 cm / culm: young, 10 cm / inflorescence: 40% developed / flower: young)

photo: G2 (general habitat: sand dune semistable blowout slope, pink flags mark plant boundary)

plant numbers: 281 plants counted in 8 m X 20 m area in two adjacent groups: 21 plants (18 with inflorescence, including 12 remains from 2001) counted in 1.5 m X 3 m area along slope base, and 260 plants (70% in inflorescence, 40% at full inflorescence development, including over culms remaining 70 from 2001) counted in 5 m X 15 m area along the erosion slope (base to crest)

note: associated with Shinneroseris rostrata (020715d) and Cyperus schweinitzii (020715e) just to the southeast

habitat: sand dune ridge blowout semistable erosion slope (24 ° toward 310 ° – NW) with very open xeric sand barrens of 50–75% SOIL (sand); 1–5% **Cyperus schweinitzii** – Calamovilfa longifolia – Carex pensylvanica – Carex obtusata; <1% Chamaerhodos erectum – Solidago missouriensis

map/date site: Cs18 – Cypesch-020716c

Eleocharis elliptica Kunth**—slender spike-rush—*CYPERACEAE***

This is a slender graminoid of non-acidic wetlands that has a provincial Rank of **SU** in Alberta, and a global Rank of **G5T5** (Vujnovic & Gould 2002, ANHIC 2002). It may be distinguished from other spike-rush species by its notably fasciated, or flattened, culm that has a loose reddish purple sheath at its base, and has an achene that is somewhat triangular, distinctly yellowish, with a minute ridge around its crest surrounding its beak. This species recently has undergone some taxonomic revision, with former treatments including *Eleocharis tenuis* var. *borealis* and *Eleocharis compressa* var. *borealis* (Kershaw *et al.* 2001). Fehr (1984) reported "*Eleocharis compressa* var. *borealis*" from a shrubby fen in his community stand 021, in the vicinity of Ribstone Creek area to the west of the ecological reserve boundary. During the survey in 2002, the author also collected a plant with fasciated culms and entire brownish culm-bases, also tentatively identified as *Eleocharis compressa* (Macdonald 020719d6). This species is included in this discussion pending confirmation of the specimens from the study area. At the time of writing, Gould (2003) related that the Reserve's collected plant material is possibly *Eleocharis elliptica*. However, there is another rare species, *Eleocharis mamillata* that should be considered. They differ in that the former has proximal bract scales that completely envelop the culm top, while the latter's scles only partially envelop the culms.

This species extends across central and northern North America, occurring in 9 provinces and 24 states, and is rare in Alberta and Saskatchewan, and in one state (NatureServe 2003). It has been mapped in *Rare Vascular Plants of Alberta* (Kershaw *et al.* 2001) from one location in the southern portion of the Boreal Forest Natural Region to the west of Edmonton but from only one location in the northwestern portion of the Parkland Natural Region, with none from its eastern portion (ANHIC 2003, Kershaw *et al.* 2001). Fehr's 1984 report recorded it from the vicinity of Ribstone Creek, west of the Wainwright Dunes Ecological Reserve's boundaries, but Macdonald collected it from the beaver dam on the large beaver pond southeast of the Great Fen.

The number of individual plants for this species occurring in the Reserve could not be accurately determined. Fehr gave no number of plants, except that it evidently was "rare", presenting a 0.5% cover in his sample plots. Macdonald's incidental collection from within the Reserve was of two plants from a concentration of at least 6 plants that presented less than a 1% cover in its habitat.

The habitat within the Ecological Reserve was a shrubby mixed marsh meadow fringe along a subhygric beaver dam with an extremely open low shrub cover of *Cornus stolonifera*, and a semiclosed mixed marsh cove of *Scirpus microcarpus* var. *rubrotinctus, Carex urticularia, Lycopus americanus, Lycopus asper, Glyceria striata* and others. The habitat to the west of the Reserve was recorded by Fehr (1984) as being a subhydric

shrubby graminoid fen along the creek in a flat stream valley basin with a semiopen thicket of *Betula pumila*, *Salix canescens* and *Cornus stolonifera* , and a semiclosed herb cover of *Carex aquatilis*, *Carex utriculata*, *Eriophorum polystachion*, *Galium boreale*, *Carex livida*, *Menyanthes trifolia* and others.

Any habitat threats to the potential number of plants within the Reserve and its vicinity would be related to the drawdown effects of the prolonged drought situation on the beaver ponds and dams, which might change the habitat conditions enough to be unfavourable for the species to survive or to allow other plants to out-compete it. Since the dam crest site also was shared with wildlife and possibly cattle as a trail for crossing the waterway, their trampling or incidental grazing may have an impact.

Management concerns for this species first should be to find and confirm the determination of the collections of Macdonald and, if any exist, of Fehr. The populations also should be refound and monitored to determine the impact of the drought and incidental wildlife and cattle movement and browsing.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Eleocharis elliptica* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type	frost (4)
Flood Hazard	not apply
Soil Drainage	imperfectly drained (5), poodly drained (6)
Perviousness	moderately (2)
Site: Macro	not apply
Site: Meso	depression (6), level (7)
Site: Micro	irregular (5), straight (1)
Site: Surface Shape	straight (1), concave (2)
Ecological Moisture Regime	hygric (7), subhygric (5), subhydric (8)
Nutrients	?mesotrophic (3)
Successional Status: 1	young seral (2)
Successional Status: 2	not apply
Disturbance Factors	water (8)

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	mid- to late June to early July
Phenology: reproductive – inflorescence	no information (?May)
Phenology: reproductive – flower	no information (?June)
Phenology: reproductive – fruit	no information (?August)
Habitat Threats	drought drawdown of stream
Management Considerations	monitoring populations

Chenopodium leptophyllum (Nutt. *ex* Moq.) Nutt. *ex* S. Wats.**—narrow-leaved goosefoot—*CHENOPODIACEAE***

This annual herb of sandy, open and wooded habitats has an provincial Rank of **SU** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). It is an erect plant with narrow, lanceolate to linear (rather than broad) leaves that are seasonally farinose (mealy) and tend to be a bluish or light green colour. It has an open panicle of minute green flowers developed in the upper leaf axils and at the terminal growing points of the stem. The determination of this species in the field is considerably problematic since it may be confused with several other common and rare species of *Chenopodium*. Of particular difficulty is the recognition of the defining minute characteristics without a microscope, such as the flower and fruit pericarp. The combination of leaves with a strictly single vein and absolutely no shorter side veins at the underside bases of the larger leaves, a tight pericarp (thin skin) that closely sticks to the horizontally oriented seeds that, at least at maturity, cannot easily be scraped off the seed, and seeds with a black but slightly wrinkled coating (testa), should separate it from the following four species. The common *Chenophyllum pratericola* (goosefoot) also is erect, but has leaves with three veins, that often must be very carefully looked for, particularly at their base, and are mealy at least to mid-season, and has a loose pericarp that can readily be separated from the seed. The rare *Chenophyllum atrovirens* (dark-green goosefoot, S1 G5) has smaller calyx-lobes that do not cover the mature seed, the plant is somewhat ascending rather than erect, and the larger leaves often have basal lobes. The rare *Chenophyllum dessicatum* (dried goosefoot, S1S2 G5) also shares small calyx-lobes, but has a loosely attached pericarp, a seed with a dark, shiny, smooth coating, three-veined leaves, and branches notably from the base. The rare *Chenophyllum subglabrum* (smooth narrow-leaved goosefoot, S1 G3G4) also has a single vein in the leaves, but is quite glabrous except perhaps in the inflorescence, and has a larger seed, about 1.5 cm long, with a loose pericarp. This is the first record of this species from the Ecological Reserve. However, there is some dispute about the determination of the vouching specimens which may appear to have loosely adherent pericarps, and indeed, may well be another provincially rare species, *Chenopodium dessicatum* (K. Vujnovic 2002, Moss 1983, Gleason & Cronquist 1991).

This species occurs in the western and central portions of the continent, in six provinces and 37 states. While its provincial Rank is being confirmed in Alberta, it is known to be rare in Ontario and extirpated from Nova Scotia, and is rare in four states (NatureServe 2003, Kershaw *et al.* 2001). In Alberta, it appears to have scattered locations in the Grassland and Parkland Natural Regions, with at least one station reported from just beyond the northeastern edge and to the south of CFB Wainwright; however, there is no accurate information confirming the number of known locations in the province (ANHIC 2003). This is the first report of the species from the Wainwright Dunes Ecological Reserve,

with a cluster of seven locations in its southwestern portion, about 3.5 km west of David Lake; the species was not reported in any of the previous biophysical surveys (fehr 1984, Cottonwood Consultants, Ltd. 1986, Anon 1998). This concentration may be an under representation related to the late seasonal development of the plants and their discovery only late into the 2002 survey period. Hence, the species may well have been overlooked prior to development of the inflorescence, or mistaken for the widespread *Chenopodium pratericola*. Fehr's 1984 report on the area did not include the species, nor any of the subsequent lists.

A total of 164 individual plants were counted in the seven locations in 2002, all occurring within the Reserve boundaries, possibly with several others to the southwest, which, however, were not properly investigated. The population numbers varied from a single to over one hundred plants in sampled areas of less than 0.1 m X 0.1 m, to 3 m X 45 m.

The main habitat of this species was the sand dune blowout erosion slopes that it shared with the other rare species, *Shinneroseris rostrata* and *Cyperus schweinitzii*. This habitat generally was the middle to upper blowout slopes that face southwest to southeast on xeric, semiactive to active, bare sand in association with an open community of *Stipa curtiseta*, *Calamovilfa longifolia*, *Carex pensylvancia* var. *digyna*, *Carex siccata*, *Helianthus couplandii*, *Lygodesmia juncea*, *Carex obtusata*, *Heterotheca villosa* and others, including the common *Chenopodium pratericola*. In one instance it was situated on the relatively level ground of a subxeric sand plain in an open shrubby grassland of *Amelanchier alnifolia*, *Prunus virginiana*, *Stipa curtiseta*, *Agropyron trachycaulum*, *Festuca campestris*, *Koeleria macrantha*, *Selaginella densa* and others. It possibly has other upland habitats in the Reserve, but they may have been overlooked in the earlier seasonal phases of the 2002 survey.

The habitat threats to this species would include erosion and deposition of sand from the blowouts, and the long-term effects of the prolonged drought in the region. Grazing from cattle was virtually non-existent in the southwestern portion of the reserve, but may be more of a factor elsewhere.

For this species, the first management concerns would be the confirmation of the vouching collections from the 2002 project. K. Vujnovic (2003) of ANHIC indicated that the specimens would be submitted for an authoritative review, possibly by Prof. H.D. Wilson of Texas A&M University, the contributor for the genus to Kartesz' (1994) synonymy texts. If this is determined to be a rare species, either *Chenopodium leptophyllum* or *Chenopodium dessicatum*, then further surveys should monitor the reported populations and search for further populations in the sandland and dune ridge habitats elsewhere in the reserve.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Chenopodium leptophyllum* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type	wind (2), insulation (3)
Flood Hazard	not apply
Soil Drainage	well-drained (3), rapidly drained (2), moderately well drained (4)
Perviousness	rapidly (1), moderately (2)
Site: Macro	not apply
Site: Meso	mid-slope (3), lower slope (4), level (7)
Site: Micro	straight (1)
Site: Surface Shape	concave (2), straight (1)
Ecological Moisture Regime	subxeric (3), submesic (4)
Nutrients	?submesotrophic (2)
Successional Status: 1	young seral (2)
Successional Status: 2	not apply
Disturbance Factors	fire (4)

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	mid- to late July
Phenology: reproductive – inflorescence	early August
Phenology: reproductive – flower	early to mid-August
Phenology: reproductive – fruit	mid-August to early September
Habitat Threats	wind erosion, grazing
Management Considerations	monitoring populations and drought impacts

Drosera linearis Goldie**—slender-leaved sundew—*DROSERACEAE***

This very small perennial herb species of marly bogs, alkaline wet sites and shores has a provincial Rank of **S2** in Alberta, and a global Rank of **G4** (Vujnovic & Gould 2002, ANHIC 2002). While small, it is very distinctive and easy to identify with its narrow, linear leaves that have reddish, dewy, glandular hairs along the upper leaf surface. Its small white flowers along a raceme, and capsules that hold black oblong seeds. In Alberta it may be mistaken for the related *Drosera anglica* which more often has obovate–linear, rather than linear, leaves, and has seeds which have distinctly attenuate rather than blunt ends.

This species occurs across Canada and the northern states east of the Rocky Mountains, occurring in eight provinces and five of the northern teir of states. It is considered also to be rare in Saskatchewan, Manitoba and Quebec, and in four of the states (NatureServe 2003). Within Alberta it is reported from 19 known locations in the the Rocky Mountain, Parkland and Boreal Natural Regions in the central portion of the province (ANHIC 2003, , Kershaw *et al.* 2001). It was first reported by Fehr (1984), from near Ribstone Creek, just to the west of the present Ecological Reserve boundaries, and within the boundaries by him, and later by Cottonwood Consulting, Ltd. (1986) from the central and southwestern portions of the Great Fen. The Great Fen site was searched diligently several times during the 2002 survey, on 15 and 16 June, 20 and 21 July, and 19 August 2002; however, no plants were rediscovered in the tall thicket fen sites or from the adjacent backshore of the large beaver pond on its southeastern side.

The number of plants of almost 20 years ago from the Great Fen, as reported by Fehr (1984), was given on his specimen label as being “fairly common – here very sparse”, while the survey of Cottonwood Consulting, Ltd. (1986) did not indicate any numbers or extent. The 2002 survey did not find the species at all, even though a reasonably intensive survey of the ample potential habitat of the Great Fen area was conducted.

Fehrs’s community sample 055 from within the Ecological Reserve was located in the Great Fen basin, located 1.5 to 3 km northwest of David Lake. He characterized it as being a hummocky depression on rolling sandland with subhygric organic soil that supported a shrubby graminoid fen with a very open low shrub cover of *Betula pumila*, and a semiclosed to semiopen herb layer of mosses, *Betula pumila* suckers, *Salix pedicellaris*, *Carex diandra*, *Carex limosa*, *Menyanthes trifoliata*, *Equisetum fluviatile*, *Triglochin maritima*, *Carex aquatilis*, *Eriophorum viridi-carinatum*, *Parnassia palustris* and other fen species. His survey of the occurrence at Ribstone Creek, outside of the Ecological Reserve’s boundaries, also described the habitat as being a subhygric organic stream basin supporting a shrubby graminoid fen of semiopen *Betula pumila*, *Salix canescens* and *Cornus stolonifera*, and semiclosed herb cover in standing water of

Carex aquatilis, *Carex utriculata*, *Eriophorum polystachion* and other fen species. The survey in 2002 examined the general UTM27 locations of Fehr's report, those of Cottonwood Consulting, Ltd. (1986), and Cliff Wallis' precise locations for this and his *Drosera anglica* collection (ANHIC 2002), and their immediate and general vicinities. However, no trace of this species was relocated. Nevertheless, the habitat here still appeared to be entirely suitable for this occurrence of this species, in spite of the effects of the drought in which, at least in the early summer when there was only local surface water evident. Neverhteless, by mid-July there was at least 5 to 12 cm depth of standing water in much of the area. A list of the 86 plant species from this habitat included two notable additions to the Reserve flora which represent considerable range extensions in the province, *Minuartia dawsoniensis* and *Silene menziesii*. Additionally, Wallis' (1990) study of saline wetlands and springs in the Grassland and Parkland Natural Regions listed this species as occurring on higher edges and hummocks of wet saline and subsaline meadows along the lake. While this phrasing appears to have referred to the hummocky seepage habitats of David Lake, it is more likely that he referred to the backshores of the large beaver pond at the southeastern end of the Great Fen where, in 2002, the pond level was considerably drawndown and the backshore habitat appeared to be most unsuitable. Further, the active seepage fen 600 m north of David Lake also was examined, but no populations were discovered there either.

The main and immediate habitat threat to this species probably is the long term impact of the drought conditions within the region, particularly where the critical habitat conditions are related to moisture regime, associated community patterns and browsing use of the site by wildlife. Grazing by cattle appeared to have no effect at this time.

The premier management consideration for this species would be to redetermine the species occurrence within the Great Fen basin. No individuals at all were found during the 2002 survey, but there was ample potential habitat in the tall thicket and shrubby graminoid fen habitats occurring within this basin. There should be a clarification of the report by Wallis (1990) for the species' occurrence along the "lake", so as to include or eliminate the David Lake backshore as a habitat within the reserve. An examination and monitoring of the long-term effects of the drought conditions on the fen habitats could be undertaken.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Drosera linearis* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type	frost (4)
Flood Hazard	not apply
Soil Drainage	poorly drained (6), very poorly drained (7)
Perviousness	slowly (3)
Site: Macro	valley floor (6)
Site: Meso level (7)	
Site: Micro	straight (1)
Site: Surface Shape	straight (1)
Ecological Moisture Regime	subhydric (8), hydric (9)
Nutrients	?submesotrophic (2), ?oligotrophic (1)
Successional Status: 1	young climax (7)
Successional Status: 2	not apply
Disturbance Factors	water related (8)

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	late June; early July
Phenology: reproductive – inflorescence	no information
Phenology: reproductive – flower	early to mid- July
Phenology: reproductive – fruit	no information
Habitat Threats	drainage due to drought
Management Considerations	monitoring populations

Table 2: Species location summary for *Drosera linearis* in the Wainwright Dunes Ecological Reserve

map site / date site	location coordinates	numbers (size)	habitat
+Dl1 – Droslin-830708a	UTM27 520500 5825550	uncommon	patterned fen along creek

plant numbers: no information
note: none
habitat: patterned fen in extensive beaverpond and fen complex
comment: the Significant Features map in Cottonwood 1986 indicated this locality to be about 52°35.900'N / 110°38.400'W ["0.1'] [map]

map/date site: **Dl5 – Droslin-90xxxxa**
location: Wainwright Dunes Ecological Reserve // NW of David Lake [Great Fen area] // T41-R5-W4 & T42-R5-W4 // UTM27 524300E 5827550N // see map Dl5
source: ANHIC // Element Occurrence PDDRO02060 # 019
reference: Wallis, C. 1990. Reconnaissance Survey of Saline Wetlands and Springs in the Grassland-Parkland Region of Eastern Alberta // reference source

code U90WAL01ABCA

observation: C. Wallis 1990

collection: no information

photo: none

plant numbers: no information

note: [Wallis recommended] “protect entire wetland basin with sufficient setback; reduce grazing pressure on meadows on lake”

habitat: “wet saline and subsaline meadows along lake; higher edges and hummocks” // elev: 665 m

comment: location is in the Great Fen, 300 m NW of the large pond, but habitat indicated that it was in vicinity of the “lake”, i.e., the beaver pond; this probably is the same location as Fehr’s report in his Stand 055 [see Dl2 above]

RECENTLY DISCOVERED SPECIES LOCATIONS

map/date site: Dl6 – Droslin-020721a

location: Wainwright Dunes Ecological Reserve; 2.3 km NNW of David Lake peninsula’s southern tip; 6–, 7–, 9–, 10–10–2–42–5W4; see map Dl5
lat./long.: (centre) 52°36.000'N / 110°38.500'W ["0.025'] [GPS]

collection: none

photos: B14 (general habitat: hygric shrubby graminoid fen and thicket fen, early summer, 15 June 2003) P23 (general habitat: hygric patterned fen in tall thicket swamp, late summer, 19 August 2003)

plant numbers: no plants observed in the general basin

note: this is the same fen habitat reported by Fehr (1984) and Cottonwood Consulting, Ltd. (1986); note also presence of Minuartia dawsonensis, Silene menziesii, Galium labradoricum; NO individual plants recorded in 2002!

habitat: extensive hygric to subhydric organic basin with thicket and shrubby graminoid fen features and scattered ancient beaver lodges and dam features supporting tall thickets [note also that this is only a general listing of the 86 species recorded by the author from basin and is not a formal quadrat-based survey]
SHRUBS: Juniperus horizontalis, Salix candida, Salix discolor, Salix lutea, Salix maccalliana, Salix myrtillifolia var. cordata, Salix pedicellaris, Salix petiolaris, Salix planifolia subsp. planifolia, Salix pseudomonticola, Salix serissima, Betula occidentalis var. occidentalis, Betula pumila var. glandulifera, Ribes lacustre, Rosa acicularis, Viburnum edule

FERNS: Equisetum fluviatile, Equisetum variegatum subsp. variegatum
GRAMINOIDS: Typha latifolia, Triglochin maritimum, Agropyron trachycaulum var. subsecundum, Bromus ciliatus, Calamagrostis inexpansa, Muhlenbergia glomerata, Poa pratensis var. pratensis*, Sphenopholis intermedia, Carex aquatilis var. aquatilis, Carex aurea, Carex bebbii, Carex canescens, Carex capillaris subsp. chlorostachys, Carex chordorrhiza, Carex diandra, Carex disperma , Carex gynocrates, Carex interior, Carex lanuginosa, Carex leptalea, Carex limosa, Carex prairea, Carex tenuiflora, Carex utriculata, Carex vaginata, Eriophorum gracilis, Eriophorum polystachion, Eriophorum viridi-carinatum, Juncus longistylis
FORBS: Smilacina trifolia, Tofieldia glutinosa var. glutinosa, Corallorhiza trifida, Cypripedium calceolus var. parviflorum, Habenaria dilatata, Habenaria hyperborea, Habenaria obtusata, Rumex occidentalis, Minuartia dawsonensis, Moehringia lateriflora, Silene menziesii var. menziesii, Stellaria crassifolia, Stellaria longifolia, Stellaria longipes, Cardamine pensylvanica, **Drosera linearis** (reported, not seen), Drosera anglica (reported, possibly in error, not seen), Mitella nuda, Parnassia palustris var. neogaea, Potentilla palustris var. palustris, Rubus pubescens, Viola renifolia, Epilobium angustifolium subsp. angustifolium, Epilobium leptophyllum, Aralia nudicaulis, Cornus stolonifera var. stolonifera, Orthilia secunda subsp. secunda, Pyrola asarifolia var. asarifolia, Arctostaphylos uva-ursi, Lysimachia thyrsiflora, Menyanthes trifoliata, Pedicularis groenlandica, Galium boreale var. intermedium, Galium labradoricum, Galium trifidum var. trifidum, Galium triflorum, Linnaea borealis var. americana, Lonicera dioica var. glaucescens, Aster borealis, Solidago canadensis var. canadensis

Gentiana fremontii Torr.**—marsh gentian—*GENTIANACEAE***

This very short biennial herb of wet calcareous meadows has a provincial Rank of **S2S3** in Alberta, and a global Rank of **G4** (Vujnovic & Gould 2002, ANHIC 2002). This is one of the smallest gentians in the province, reaching only up to 10 cm tall, and is semiprostrate to erect, with opposite, small, scale-like, ovate leaves. It has single small greenish-purple to white flowers at the stem tips, and capsules that flare at their tips. This species differs from the related *Gentiana prostrata* of the Rocky Mountains, in having scarcely recurving, white-margined or scarious leaves (rather than distinctly recurving, green-margined in this species), and a capsule that is sessile (rather than on a distinctly elongated stalk). Young plants may be mistaken for a variety of young herb species, notably members of the *Caryophyllaceae* which also have small, opposite leaves, but thattend not to arise from a small glabrous basal rosette and have separate petals. Indeed, finding this species in its shrubby or meadow habitats is difficult due to its small size. This species has been known as *Gentiana aquatilis auct., non* L., and was treated under *Gentiana prostrata* Haenke *ex* Jacq. var. *americana* Engelmann in the *Flora of Alberta* of Moss (1983).

This species occurs in the western third of North America and also in eastern Asia. In Canada it is rare in the two or the four provinces in which it occurs, Alberta and Saskatchewan, and in the United States it is rare in two of the seven states where it occurs (NatureServe 2003, Kershaw *et al.* 2001). As well, Argus and Pryer (1990) included this species in their list of nationally rare species. In Alberta it has been recorded from ten known locations in the Parkland Natural Region's western portion, with the Wainwright Dunes Ecological Reserve being the only report from its eastern portion (ANHIC 2003). It was first recorded within the reserve by Fehr (1984) from a 1983 collection on the north shore of David Lake, and next by Cottonwood Consultants, Ltd. (1986) who indicated it on the significant features map, and had a 1986 specimen collection by C. Wallis from the vicinity of the peninsula's eastern offshore. Unfortunately, the label reference information is vague or contradictory for both these locations, stating in words the north shore of David Lake, but giving sectional or UTM27 locations removed from the lake or their described habitat (ANHIC 2002). The current survey did discover three general locations for the species, with two sampled locations within the Ecological Reserve's boundaries on the northern and southwestern sides of David Lake's backshore, and two proximate locations just 175 m to the east of the Reserve's boundary on the lake's northern backshore.

There is no information on the number of plants in the previously discovered locations for this species, except to indicate that they were "occasional". The current survey discovered a total of at least 329 individual plants in 2002; however, only three plants were at two locations within the Reserve boundaries, and the rest were outside the

boundaries. Given the difficulty of seeing this very small species in the thicket and graminoid meadow undergrowth, the populations undoubtedly were under-sampled. In the two locations within the boundaries, only one or two plants were discovered within large sampled polygons that were 15 m X 40 m and 10 m X 30 m. However, it is likely that the number of individual plants is larger, particularly in light of the species location discovered just barely outside the Reserve, where a 15 m X 25 m sample in the habitat enclosed 142 counted plants in 29 clusters, and another sample had 184 plants counted in 24 small clusters in a 10 m X 107 m area. Over the entire 110 m X 500 m area of the tall thicket zone along this portion on the David Lake north backshore, there probably were well over 1 000 plants. The phenology of the plants here had flowering plants in Fehr's collection from late May 1983 and Macdonald's record from mid-July 2002, although these probably represent the extreme begining and end to the flowering period, which normally would be in June. In 2002, fruit were developing prior to early July and probably matured into late July, with well over 20% of the population at mid-fruiting by mid-July, and all seeds matured and shed by mid-August.

Wallis' 1990 study of saline wetland and spring habitats indicated that this is a "facultative wetland species, scarce in saline seepage meadows, most frequent along drier edge in wire rush (*Juncus balticus*) communities". The collection of A. Fehr at the Alberta Parks and Protected Areas herbarium was from a "hummocky *Betula* [*occidentalis*] – *Salix* [?*maccalliana* or ?*pseudomonticola*]" fen which was either associated with the David Lake backshore or was in a depression on the sandlands to the north of the lake. C. Wallis' collection at the University of Alberta herbarium indicated that the habitat was "hummocks and moist meadows [dominated by *Antennaria*, occurring] along the lake". The 2002 survey sampled the hummocky meadows both in the near- and offshore situations along the eastern portion of the David Lake peninsula and the northern side of David Lake, but no populations of this species were recorded. These backshore meadows were dominated by *Deschampsia cespitosa*, *Juncus balticus*, *Agropyron trachycaulum*, *Potentilla anserina*, *Crepis runcinata*, and others, while the offshore meadows were dominated by *Juncus balticus*, *Potentilla anserina*, *Glaux maritima*, *Agropyron trachycaulum*, *Deschampsia cespitosa*, *Puccinellia nuttalliana* and *Hordeum jubatum*. Additionally the well-developed hummocky terrain of the seepage slopes on the peninsula also was searched, but without success. In wetter climatic conditions these sites were hygric with flowing, calcareous surface water. The meadows now, however, supported a much drier complement of species, including the notable carpets of *Antennaria parvifolia* indicated by Wallis, with Juncus balticus, Distichlis stricta, Calamagrostis stricta, Carex scirpoidea, Glaux maritima, several of the calcareous fen species, such as *Primula incana*, *Lobelia kalmii* (Kalm's lobelia), *Carex aurea*, *Senecio pauperculus*, and even the rare *Carex parryana*. The hummock terrain was probably formed by the trampling of cattle through the soft soils as part of their grazing pattern; in

many instances these hummocks are over 25 cm or 35 cm tall. The *Gentiana fremontii* plants probably would occur on the crests or sides of these hummocks; however, the species was not recorded from these habitats in 2002, probably due to their now very dry moisture regime caused by the prolonged drought conditions. The plants that were discovered during the 2002 survey occurred in two general backshore thicket and shrubby graminoid fen habitats. These sites would have had hygric to subhydric moisture regimes in wetter climates, but the severe regional drought reduced the available ground moisture to subhygric conditions, with no sign of flowing ground water. The shrubby graminoid fen community had an very open to semiopen, medium height shrub complement of *Salix maccalliana*, *Salix pseudomonticola*, *Salix petiolaris*, *Salix planifolia* (flat-leaved willow), *Betula occidentalis*, *Populus balsamifera* saplings and *Salix candida*, and a semiclosed herb cover of *Carex lanuginosa*, *Carex aurea*, *Calamagrostis stricta*, *Juncus balticus*, *Deschampsia cespitosa*, *Potentilla anserina*, *Carex aquatilis*, *Festuca ?trachyphylla* (tall red fescue), *Solidago canadensis* (Canada goldenrod) and several species associated with the alkaline seepage sites, such as *Carex capillaris* subsp. *chlorostachys*, *Eleocharis quinqueflora*, *Parnassia palustris*, *Primula incana*, *Senecio pauperculus*, *Lobelia kalmii*, *Crepis runcinata*, *Juncus longifolius*, *Dodecatheon pulchellum*, *Gentiana crinita*, *Gentianella amarella* and others, including the rare *Lycopus americanus* and *Carex crawei*. The tall thicket community on the lake's northern backshore habitat presented a semiopen tall shrub cover of *Salix maccalliana, Betula occidentalis* and *Populus balsamifera* saplings, a semiopen lower shrub cover that included the above tall shrub species and *Salix petiolaris* and *Salix pseudomonticola*, and a semiclosed to closed herb cover of *Deschampsia cespitosa*, *Juncus balticus*, *Potentilla anserina*, *Carex aurea*, *Carex scirpoidea*, *Carex capillaris* and many of the calcareous seepage slope species indicated above, but with a more sparse presence. It is likely that this tall thicket community on the lake's northern backshore originally extended eastward from the reserve's eastern boundary onto the now open shrubby graminoid meadow that had the much larger population of *Gentiana fremontii*. A conversation with the rancher who has been stewarding the area indicated that this area had been cleared of growth in the past ten years, and that the more open shrubby growth had developed since then (Maull 2002).

The major habitat threat to the species in the Reserve is associated with the long-term regional drought conditions that have caused a considerable drawdown of the lake's water level, resulting in a notable lowering of the water table and change in the moisture regime from subhydric to subhygric. As well, the surface water seepage from the springs that previously was prevalent, had virtually ceased. The effect on the habitats has been enough to encourage the species cover values to change, more mesic species to invade, and the species to be exposed to more extreme temperature changes. The clearing of the potential habitats along the northern shore of David Lake may have had

both desirable and undesirable effects on the populations. It is apparent that the known population in the cleared area now has quite an impressive size, perhaps due to the 'releasing' effects of opening the canopy. However, such clearing also may have eliminated other features. Actual grazing in the habitats did not appear to have had direct effects on the populations of this rare plant; its small size certainly does not expose it to aggressive selection for forage.

Management considerations here must involve monitoring the known species locations, both within and beyond the immediate Reserve boundaries, resurveying the formerly reported hummocky meadow sites when the drought conditions decline, determining the actual impact of the drought on the species' survival, and evaluating the impact of the clearing procedures on the lake's northern backshore thicket habitat for the species.

Site: Macro	not apply
Site: Meso	level (7)
Site: Micro	hummocky (2), straight (1)
Site: Surface Shape	straight (1)
Ecological Moisture Regime	hygric (7), subhydric (8)
Nutrients	?permesotrophic (4), mesotrophic (3)
Successional Status: 1	?young edaphic (6)
Successional Status: 2	not apply
Disturbance Factors	water (8), site imrpovement (7)

ANHIC RARE NATIVE PLANT REPORT

Phenology: vegetative	mid- to late May
Phenology: reproductive – inflorescence	mid-May to mid-July
Phenology: reproductive – flower	late May, to mid-July
Phenology: reproductive – fruit	late June, to early, mid- to late July
Habitat Threats	drought drawdown of lake; habitat clearing; grazing
Management Considerations	monitoring populations; drought impact

Species location summary for *Gentiana fremontii* in the Wainwright Dunes Ecological Reserve (+ indicates adjacent to ecological reserve)

map site / date site	location coordinates	number (size)	habitat
Gf1 – Gentfre-830527a	SE–11–42–5W4	no information	hummocky thicket fen Betula – Salix
Gf2 – Gentfre-860614a	UTM27 526500 5826250	no information	hummocks & moist meadows along lake
Gf3 – Gentfre-86xxxxa	no information	no information	lower hill slope seepage fen
Gf4 – Gentfre-90xxxxa	N shore David Lake, vicinity	no information	saline spring
Gf5 – Gentfre-020613d	52°35'07.5"N 110°37'00.5"W	none seen	hummocky hygric meadow

PREVIOUSLY REPORTED SPECIES LOCATIONS

map/date site:	**Gf1 – Gentfre-830527a**
location:	Wainwright Dunes Ecological Reserve // N shore of David Lake [see below] // SE11–42–5W4 // see map Gf1
source:	Fehr, . (collection at PP)
reference:	—
observation:	A. Fehr 27 May 1983
collection:	Fehr, A. s.n. // 27 May 1983 // PP- (no number) // det: K.E. Tannas // vidi & stet IDM–02
photo:	no information
plant numbers:	"occasional"
note:	"Rocky Mountains / Prairies"
habitat:	"hummocky Betula – Salix fen"*
comment:	this specimen not entered into ANHIC data base; specimen at Alberta Parks herbarium; the location above would be approximately 700 m to 1.5 km N of the David Lake north shore where there are wetland thickets in sandland depressions; no plants rediscovered in this general area during 2002 survey; * the vegetation would be Betula [occidentalis]! – Salix [maccalliana]?; see also Gentfre-020815f

map/date site:	**Gf2 – Gentfre-860614a**
location:	Wainwright Dunes Ecological Reserve // David Lake // T41-R5-W4 & T42-R5-W4 // UTM27 526500E 5826250N // see map Gf2
source:	ANHIC // Element Occurrence PDGEN060Y0 # 003
reference:	Cottonwood Consulting, Ltd. 1986. The Proposed Wainwright Ecological Reserve—A Biophysical Overview. Alberta Recreation and Parks, Edmonton.
observation:	C. Wallis 1986
collection:	Wallis, C. 1986-06-14 // UA#098392 // det OK // specimen source code S86WALUAABCA06
photo:	no information
plant numbers:	no information
note:	"flowering"
habitat:	"hummocks and moist meadows along lake dominated by Antennaria" // elev: 665 m
comment:	this location would be in the offshore zone of the northern end of David Lake, probably closer to the actual high level shoreline; no plants rediscovered at this location during 2002 survey

map/date site: **Gf3 – Gentfre-86xxxxxa**
location: Wainwright Dunes Ecological Reserve // reported from slope north of David Lake in seepage fen hillside // see map Gf3
source: ANHIC // Element Occurrence PDGEN060Y0 # 003
reference: Cottonwood Consultants, Ltd. 1986. The Proposed Wainwright Ecological Reserve—A Biophysical Overview. Alberta Recreation and Parks, Edmonton AB.
observation: C. Wallis 1986
collection: Wallis, C. 1986-06-14 // UA#098392 // det OK // [see above]
photo: no information
plant numbers: no information
note: [Fehr's 1984 report alludes to this slope seepage fen, but does not list the species from here]
habitat: "lower hill slope seepage fen"
comment: no relocation information available

map/date site: **Gf4 – Gentfre-90xxxxa**
location: Wainwright Dunes Ecological Reserve // David Lake // T41-R5-W4 & T42-R5-W4 // UTM27 526500E 5826250N // see map Gf4
source: ANHIC // Element Occurrence PDGEN060Y0 # 003
reference: Wallis, C. 1990. Reconnaissance Survey of Saline Wetlands and Springs in the Grassland-Parkland Region of Eastern Alberta. source code U90WAK01ABCA
observation: C. Wallis 1986
collection: no information
photo: none
plant numbers: no information
note: flowering
habitat: hummocks and moist meadows along lake dominated by Antennaria // elev: 665 m
comment: this location would be on the actual shoreline of the northern end of David Lake; no plants rediscovered during 2002 survey; this refers to the Cottonwood Consulting, Ltd 1986 report

RECENTLY DISCOVERED SPECIES LOCATIONS

map/date site: **Gf5 – Gentfre-020613d**
location: Wainwright Dunes Ecological Reserve; NW side of David Lake at neck of the peninsula, ca 100 m N of peninsula's southern tip and ca 25 m SW of

the aspen grove; 7–2–42–5W4; see map Gf5
lat./long.: (centre) 52º35'07.5"N / 110º37'00.5" [0.025'] [GPS]

collection: none

photo: see also Carex parryana photos; A24 (habitat detail: now-subxeric seepage slope hummock site, looking N) A25 (habitat detail: now-subxeric seepage slope hummock site, looking NW) A26 (habitat detail: now-subxeric seepage slope hummock site, scale to pen)

plant numbers: no plants recorded in 2002; this is a formerly reported general habitat and location

note: reported to be the habitat and possibly the location of Gentiana fremontii for previous sightings of the gentian, but due to the drought conditions, none observed during 2002; associated with Carex parryana; hummock landform created by grazing cattle trampling when site is moister; see Carex parryana 020613c

habitat: very gentle seepage slope, now essentially dry, with alkaline sand hummocks having a closed meadow of 50–75% Distichlis stricta – Antennaria parvifolia; 5–20% Agropyron trachycaulum – Carex ?stenophylla; 1–5% Carex scirpoidea – Deschampsia cespitosa; <1% Smilacina stellata – Cirsium flodmanii – Poa pratensis – Equisetum arvense – Anemone ?multifidum – Thalictrum venulosum – Anemone cylindrica – Solidago missouriensis – Aster ericoides – Sonchus uliginosus – Juncus balticus – Potentilla pensylvanica – Glaux maritima – Achillea millefolium – Artemisia frigida – Calamagrostis ?inexpansa – Taraxacum officinale – Silene drummondii – Symphoricarpos occidentalis – Juniperus horizontalis – Salix ?petiolaris

map/date site: Gf6 – Gentfre-020613e

location: Wainwright Dunes Ecological Reserve; NW side of David Lake at neck of peninsula, ca 100 m N of its southern tip; 7–2–42–5W4; see map Gf6

Asclepias ovalifolia Dcne.**—low milkweed—*ASCLEPIADACEAE***

This medium height herb species of open woods, sloped and moist prairies has a provincial Rank of **S3W** in Alberta and a global rank **G5?**, and currently is on the watch list for the province (Vujnovic & Gould 2002; ANHIC 2002, 2003). It is a perennial broad-leaved milkweed which differs from the more common *Asclepias speciosa* (showy milkweed) in having somewhat pubescent, oval-shaped to lanceolate, opposite leaves that are pointed at the tip, but tapered at their base (rather than cordate or rounded), fruit pods that are smooth (rather than having soft tubercles on the surface), flowers that are greenish-white (rather than pink or purplish), and are somewhat smaller in overall size. Additionally, it differs from the provincially rare *Asclepias viridiflora* (green milkweed) which is similar in also having greenish flowers and smooth fruits, but often has additional subterminal inflorescences, cordate leaf bases and no 'horn' structure within the flowers (Moss 1983, Scoggan 1979, Gleason & Cronquist 1991).

This species occurs in the central to west central portions of North America, in five provinces between British Columbia and Ontario, and in ten states along the northern tier of central and midwestern United States. It is rare and possibly extirpated from Ontario, and is rare in five states and is on the provincial Watch list in Alberta (NatureServe 2003, Vujnovic & Gould 2002). In Alberta, it has 26 known locations which occur within the Parkland Natural Region with several in the southern portion of the Boreal Forest Natural Region (Kershaw *et al.* 2001, ANHIC 2003). Several localities within 25 km of the Reserve have been reported (ANHIC 2002). The first reports for this species within the Wainwright Dunes Ecological Reserve were by Bradley & Bradley (1977) and Fehr (1984), but no species locations were given. Cottonwood Consulting, Ltd. (1986) next reported it from the sandlands to the northwest of the Great Fen pond. This report was reiterated in the management plan for the Ecological Reserve (Anon 1998). During the survey in 2002, an additional sixteen species locations were discovered in four general clusters: two about 0.5 km west of David Lake, five about 0.5 km northwest of the Great Fen pond, eight about 1 km north northwest of the Great Fen pond, and one about three km north of David Lake.

The size of the species locations in the Ecological Reserve varied from 1 m X 6 m to 25 m X 40 m, and their numbers from 4 plants to 444 plants. Throughout the Reserve, the total accumulative number of plants was counted as 1 317 plants in 16 the recently sampled locations. In the 2002 survey, their development appeared to have their leaves mostly expanded by mid-June, their inflorescences developed by late June to early July, their flowers mostly at anthesis by early to mid-July and possibly to late July, and fruit development probably normally proceeding between mid- to late July and early to mid-August. However, due to the drought conditions and extreme heat during July 2002, the

flowers generally experienced considerable dessication, and essentially had their development toward fruit production arrested by late July. Indeed, none of the species locations investigated during the mid- and late summer of 2002 had any but the most rudimentary fruit development, and in several cases, many flowering inflorescences were abscising from the plant stem by the end of mid-July.

The habitats of its populations most often occurred along the southwest-facing, uppermost slopes and crests of the low sand ridges that supported submesic to subxeric native grasslands that were adjacent to backslope aspen groves and their marginal zones of successional open thickets of *Prunus virginiana* and *Populus tremuloides* saplings. The associated herb cover included *Bouteloua gracilis*, *Calamovilfa longifolia*, *Selaginella densa*, *Koeleria macrantha*, *Agropyron trachycaulum*, *Stipa curtiseta*, *Thermopsis rhombifolia* (golden bean), *Carex pensylvanica* and others. In several instances they also occupied openings in young to subintermediate-aged mesic aspen groves and forests in association with *Selaginella densa*, *Bouteloua gracilis*, *Calamovilfa longifolia*, *Carex pensylvanica*, *Oryzopsis pungens*, *Solidago missouriensis*, *Thermopsis rhombifolia*, *Schizachne purpurascens*, *Aster laevis* (smooth aster), *Smilacina stellata* and others.

There do not appear to be any immediate habitat threats to this species within the Ecological Reserve. Wildlife browsing by deer and moose was very minimal, with only two plants recorded as having been nibbled at one location. Trampling along ungulate trails has a potential impact of the plants but was not actually observed during the 2002 survey, and cattle grazing was not evident in the portions of the Reserve where the plant populations occurred.

Management considerations for this species would be limited to monitoring the species' populations and cattle grazing patterns in their habitats, and limiting hiking along the convenient ungulate trails. The succession of an aspen grove cover over the habitats in the future may well shade out the species. Burning in the habitats may affect the above-ground plant parts, although the rhizomes probably would persist to further the survival of the plants at their locations.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Asclepias ovalifolia* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type (88 89)	not apply
Flood Hazard (90)	not apply
Soil Drainage (91)	rapidly drained (2), well drained (3)
Perviousness (92)	rapidly (1), moderately (2)
Site: Macro (93)	plain (7)
Site: Meso (94)	crest (1), upper slope (2), lower slope (4)
Site: Micro (95)	straight (1)
Site: Surface Shape (96)	convex (3), concave (2)
Ecological Moisture Regime (97)	subxeric (3), mesic (5), submesic (4)
Nutrients (98)	?submesotrophic (2)
Successional Status: 1 (99)	young seral (2)
Successional Status: 2 (101)	not apply
Disturbance Factors (102-106)	fire (4)

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	mid-June
Phenology: reproductive – inflorescence	mid- to late June, early July
Phenology: reproductive – flower	early to mid- to late July
Phenology: reproductive – fruit	late July, early August
Habitat Threats	trampling, grazing, fire
Management Considerations	monitoring populations, limiting access

Species location summary for *Asclepias ovalifolia* in the Wainwright Dunes Ecological Reserve

map site / date site	location coordinates	number (size)	habitat
Ao1 – Asclova-77xxxxa	no information	no information	no information
Ao2 – Asclova-84xxxxa	no information	no information	no information
Ao3 – Asclova-86xxxxa	NE3–10–42–5W4	no information	sand hill grassland
Ao4 – Asclova-	52°34.926'N 110°38.189'W	20	grassy sand ridgecrest

map site / date site	location coordinates	number (size)	habitat
020614e		(5m X 50m)	
Ao5 – Asclova-020614f	52°34.927'N 110°38.418'W	40 (5m X 20m)	grassy sand ridge crest
Ao6 – Asclova-020615g	52°35.839'N 110°38.425'W	13 (3m X 30m)	aspen grove fringe
Ao7 – Asclova-020714b	52°36.457'N 110°38.328'W	444 (25m X 40m)	thicket edge on sand ridge
Ao8 – Asclova-020714c	52°36.472'N 110°38.364'W	117 (7m X 8m)	dune ridge upper slope meadow
Ao9 – Asclova-020714d	52°36.504'N 110°38.402'W	8 (3m X 7m)	dune ridge slope meadow
Ao10 – Asclova-020714e	52°36.568'N 110°38.467'W	14 (4m X 7m)	dune ridge slope meadow
Ao11 – Asclova-020714g	52°36.515'N 110°38.415'W	50 (3m X 5m)	dune ridge slope meadow
Ao12 – Asclova-020715a	52°36.289'N 110°38.440'W	242 (10m X 64m)	dune ridge crest meadow
Ao13 – Asclova-020715b	52°36.320'N 110°38.565'W	16 (6m X 24m)	dune ridge crest meadow
Ao14 – Asclova-020716a	52°36.409'N 110°38.235'W	8 (5m X 12m)	grassy sandland
Ao15 – Asclova-020718d	52°36.928'N 110°36.438'W	26 (20m X 20m)	grassy sand ridge upper slope
Ao16 – Asclova-020720a	52°35.890'N 110°38.537'W	58 (12m X 30m)	dune ridge slope crest
Ao17 – Asclova-020720b	52°35.919'N 110°38.541'W	4 (1m X 6m)	dune ridge aspen grove edge
Ao18 – Asclova-020720c	52°35.919'N 110°38.579'W	71 (8m X 16m)	dune ridge grassland
Ao19 – Asclova-020720d	52°35.948'N 110°38.598'W	186 (10m X 30m)	dune ridge grove opening

PREVIOUSLY REPORTED SPECIES LOCATIONS

map/date site: Ao1 – Asclova-77xxxxa
location: Wainwright Dunes Ecological Reserve // (see comment) // not mapped
source: Fehr, A. 1984. Wainwright Study Area: Biophysical Inventory. Natural Areas Program, Public Lands Division, Alberta Energy and Natural Resources, Technical Report No. t/65, Edmonton.
reference: Bradley, L. and C. Bradley. 1977. Aspen Grove resource assessment: Wainwright area. Parks Planning and Design Branch, Alberta Recreation, Parks and Wildlife, Edmonton.
observation: L. Bradley and C. Bradley, 1977
collection: no information
photo: no information
plant numbers: no information
note: none
habitat: no information
comment: cited in Fehr's general species list; no location or other information

map/date site: Ao2 – Asclova-84xxxxa
location: Wainwright Dunes Ecological Reserve // (see comment) // not mapped
source: Fehr (1984)
reference: Fehr, A. 1984. Wainwright Study Area: Biophysical Inventory. Natural Areas Program, Public Lands Division, Alberta Energy and Natural Resources, Technical Report No. t/65, Edmonton.
observation: A. Fehr, 1983
collection: no information
photo: none
plant numbers: no information
note: none
habitat: no information
comment: cited in Fehr's general species list; no location or other information

map/date site: Ao3 – Asclova-86xxxxa
location: Wainwright Dunes Ecological Reserve // (see comment) // see map Ao3
source: Cliff Wallis 1986
reference: Cottonwood Consultants, Ltd. 1986. The Proposed Wainwright Ecological Reserve—A Biophysical Overview. Alberta Recreation and Parks, Edmonton AB.

observation: C. Wallis 1986
collection: no information
photo: no information
plant numbers: no information
note: none
habitat: no information
comment: The Cottonwood 1986 report maps of significant features places this in the vicinity of NE3–10–42–5W4; species not listed in Fehr's 1984 community stand data

RECENTLY DISCOVERED SPECIES LOCATIONS

map/date site: Ao4 – Asclova-020614e
location: Wainwright Dunes Ecological Reserve; 1.3 km WSW of David Lake peninsula's southern tip; NE2–3–42–5W4; see map Ao5
lat./long.: (centre) 52°34.926'N / 110°38.189'W [0.025'] [GPS]
collection: 020614b6 (1 replicate @ ALTA / young plants: 12 – 15 cm / leaf: full / inflorescence: young / flower buds only)
photos: A36 (general habitat: dune ridge grassland, looking SE) A37 (habitat: sand ridge crest grove fringe)
plant numbers: 20 plants counted in 5 m X 80 m area in two groups of 8 (3 m X 10 m) and 12 (3 m X 60 m); 35% in mature inflorescence; population extends to NW
note: general unquantative survey
habitat: sand dune ridge upper slope subxeric sand with semiclosed grassland of Agropyron trachycaulum – Carex stenophylla – Bouteloua gracilis – Stipa curtiseta – Calamovilfa longifolia – Thermopsis rhombifolia – Carex pensylvanica – Smilacina stellata – **Asclepias ovalifolia**

map/date site: Ao5 – Asclova- 020614f
location: Wainwright Dunes Ecological Reserve; 1.6 km WSW of David Lake peninsula's southern tip; NW2–3–42–5W4; see map Ao5
lat./long.: (centre) 52°34.927'N / 110°38.418'W [0.025'] [GPS]
collection: none
photo: none
plant numbers: 40 plants counted in 5 m X 20 m area; all vegetative
note: general unquantative survey
habitat: sand dune ridge upper slope and crest subxeric sand with grassland of Calamovilfa longifolia – Bouteloua gracilis – Stipa curtiseta – Carex stenophylla – Selaginella densa – Artemisia frigida – Solidago missouriensis

– Festuca saximontana – **Asclepias ovalifolia**

map/date site: Ao6 – Asclova - 020615g

location: Wainwright Dunes Ecological Reserve; 2.2 km NW of David Lake peninsula's southern tip; NE3–10–42–5W4; see map Ao6
lat./long.: (centre) 52°35.839'N / 110°38.425'W [0.025'] [GPS]

collection: 020615a11 (1 replicate @ ALTA / young plants: 18 cm / inflorescence: young, heads only / flower buds only)

photo: none

plant numbers: 13 plants counted in 3 m X 30 m area; none with inflorescence developed

note: none

habitat: sand dune ridge upper slope (3°–5° toward 105° – SSE) and crest subxeric to submesic sand with young semiopen grove of TREE (semiclosed to semiopen) 20–50% Populus tremuloides; SHRUB (semiopen) 20–50% Prunus virginiana – Corylus cornuta – Amelanchier alnifolia; HERB (semiclosed to closed) 50–75% Agropyron trachycaulum – Thalictrum venulosum – Carex siccata; 5–20% Thermopsis rhomboidea – Galium boreale; 1–5% Oryzopsis asperifolia – Aster laevis; <1% Maianthemum canadense – Schizachne purpurascens – Carex pensylvanica – Poa sandbergii – Achillea millefolium – Solidago missouriensis – **Asclepias ovalifolia**

map/date site: Ao7 – Asclova - 020714b

location: Wainwright Dunes Ecological Reserve; 3.1 km NNW of David Lake peninsula's southern tip; NE15–10–42–5W4; see figure and map Ao7
lat./long.: (centre) 52°36.460'N / 110°38.330'W [0.025'] [GPS]

collection: 020714b1 (2 replicates @ UAC ALTA / stem: 24–32 cm / leaf: full / inflorescence: mature / flower: mature, stunted due to drought and dessication)

photos: E21 E22 (plant detail with flowering inflorescence) F14 (general habitat: dune ridge crest grassland looking NW, pink flags mark plants) F15 (habitat detail: opening in dune ridge basin grove looking SE, pink flags mark plants)

plant numbers: 444 plants counted in 25 m X 40 m area in three groups of 69 (4 m X 20 m on slope crest grassland), 219 (7 m X 22 m at midslope grassland), 156 (5 m X 8 m in basin grove); 40% in mature inflorescence with flower development, additional plant locations extend to northwest, see 020714c

note: marked by pink ribbon at SE end of site; NE facing back slope of the ridge has aspen forest

habitat 1: sand dune ridge upper slope and crest subxeric sand aspen grove fringe meadow of TREE (extremely open) 1–5% Populus tremuloides; LOW SHRUB (very open) 5–20% Prunus virginiana; 1–5% Juniperus horizontalis; <1% Rosa woodsii; HERB (semiclosed to closed) 50–75% Selaginella densa – Bouteloua gracilis; 5–20% Calamovilfa longifolia – SOIL (sand); 1–5% Koeleria macrantha – Thermopsis rhombifolia – Stipa curtiseta – **Asclepias ovalifolia**; <1% Carex obtusata – Artemisia ludoviciana var. ludoviciana – Cladonia mitis – Heterotheca villosa – Erysimum asperum

habitat 2: sand dune ridge slope basin subxeric sand with successional open grove of TREE (extremely open) 1–5% Populus tremuloides; SHRUB (open) 5–20% Populus tremuloides (sapling) – Prunus virginiana; HERB (semiclosed to closed) 50–75% Selaginella densa – Bouteloua gracilis; 5–20% Calamovilfa longifolia – LITTER – Cladonia mitis; 1–5% Carex pensylvanica – Oryzopsis pungens – Solidago missouriensis – SOIL (sand); <1% Juniperus horizontalis – **Asclepias ovalifolia** – Thermopsis rhomboidea – Schizachne purpurascens – Aster laevis – Achillea millefolium – Artemisia ludoviciana var. ludoviciana – Comandra umbellata var. pallida – Campanula rotundifolia – Silene drummondii

map/date site: Ao8 – Asclova - 020714c

Lycopus americanus Muhl. *ex* W.C. Barton**—American water-horehound—*LAMIACEAE***

This perennial, low herb species of marshy sites and moist stream sides has a provincial Rank of **S2** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, Kershaw *et al.* 2001, ANHIC 2002). It is an erect, deciduous plant with long rhizomes and stolons, growing in the ecological reserve to about 42 cm tall. It has opposite, deeply toothed, laciniate to pinnate, short hirsute leaves with distinct petioles. The inflorescence has very small, clusters of white, five-petalled flowers in each of the leaf axils, with narrowly triangular sepals that are over twice as long as wide at their base and are up to 2 mm long. The fruits are nutlets that are 1.0 – 1.4 mm wide X 0.7 – 1.0 mm long that form groups of four with a depressed center. This is one of the larger members of this genus in the province. It may be readily differentiated from the common *Lycopus asper* which has leaves that are merely toothed and are bluntly sessile, and has nutlets that are larger, mostly 1.6 – 2.1 mm wide X 1.4 – 1.8 mm long, and bears tubers at the stem base. As well, the common but smaller *Lycopus uniflorus* that has toothed leaves that taper to short petioles and are essentially glabrous, broadly triangular sepals which are less than twice as long as wide at their base and under 1 mm in length, and are shorter than the nutlets. Additionally, it may be distinguished from the more eastern *Lycopus virginicus* which has four petals, and from the European *Lycopus europaeus* which has longer and stiffer hairs on the lower leaf surface and anthers longer than 0.5 mm, neither of which have been reported in Alberta (Moss 1983, Gleason & Cronquist 1991, Scoggan 1979).

This species occurs across virtually all of North America south of the 60º latitude, with the exception of Nevada and Labrador, and is considered to be rare in Canada in the provinces of Alberta and Newfoundland, and in the United States in two southeastern states (NatureServe 2003, Kershaw *et al.* 2001,). Within the province it is known from 14 widely spaced known locations in the Grassland and Parkland Natural Regions, with at least one other station in the Wainwright area (ANHIC 2003). The biophysical studies of the Ecological Reserve and its immediate vicinity by Bradley & Bradley (1977), Fehr (1984) and Cottonwood Consultants, Ltd. (1986) presented the initial reports of the species occurrence here, with at least three locations, and the 2002 survey discovered an additional 17 locations, for a total of 20. Four of these sampled sites were located around the northern, western and southwestern backshores of the David Lake basin, five to the southeast of the Great Fen pond, three to the northeast of the Great Fen, two in the spring fen 600 m north of David Lake, and one just outside the eastern boundary of the Reserve, 2.5 north of the lake.

The total population of the species at the various locations within the Reserve is 887 individual plants, with and additional 15 being mere metres outside its eastern boundary. The previous records did not give accurate population sizes, except to indicate that they

were “uncommon – here sparse”. The populations occurred in areas from 1 m X 3 m to 10 m X 60 m, and in all probability they also extended around the northern shore of David Lake in a 100 m X 500 m area. The sampled numbers of individuals in the populations ranged from single plants to over 90 plants, and along the David Lake northern backshore there possibly are over 3 000 plants, based on 25 m X 25 m and 15 m X 30 m samples within the area. The phenology of the plants in the Reserve in 2002 had the leaves in young development stage by mid- to late June, and at least half developed by early July. The inflorescences were developing in the leaf axils by early to mid-July, and the flowers were appearing over a two month period between early- to late July and into mid- or late August. The nutlet development also was continuous between mid- to late July, to early to mid- to late August, and into early September.

Wallis’ study of saline wetlands and springs (1990) described this as being an “obligate wetland species, very local in springs ...”. The species occupied three different wetland and lowland habitats within the Reserve. Potentially the largest populations occupy the tall thicket communities of the backshore around David Lake. Along its northern backshore was a subhygric tall thicket of semiclosed *Betula occidentalis*, *Salix maccalliana*, *Salix planifolia*, *Salix pseudomonticola*, *Cornus stolonifera*, *Juncus balticus*, *Crepis runcinata*, *Solidago canadensis*, *Deschampsia cespitosa*, *Carex viridula*, *Carex aurea*, *Glyceria striata*, *Senecio pauperculus*, *Rubus pubescens* and others. Also associated with this habitat were several of the calcareous seepage species, such as *Parnassia palustris*, *Lobelia kalmii*, *Primula incana*, and the rare *Gentiana fremontii* and *Carex crawei*. It is in this extensive habitat that there is the potential for over 3,000 plants to occur. At the southwestern backshore of the lake the species occurred in much sparser numbers in a subhygric semiopen low thicket of *Salix lutea* (yellow willow), *Salix serissima* (autumn willow), *Salix candida* (hoary willow), *Calamagrostis stricta*, *Carex aurea*, *Juncus balticus*, *Solidago canadensis* and several of the calcareous seepage species, including the rare *Gentiana fremontii*. Additionally,a modest number of plants of the species was supported in a tall thicket habitat that formed a fringe around a wetland basin 600 m to the north of David Lake, that also was dominated by *Betula occidentalis, Salix pseudomonticola, Salix sericea* and *Carex aquatilis*, with many swamp forest species. Fehr’s community sample 043 probably was this same community, but his survey captured it in a non-drought situation, with standing water and a greater variety of marshland sedges, such as *Carex aquatilis, Carex lasiocarpa* (probably actually Carex lanuginosa) and *Carex utriculata* being evident. This thicket community also occurred along the lake’s northern side, but to the east of the Reserve boundary, no plants of this species were located there. A variation of this thicket community occurring in a subhygric basin in the sand plain which was well-removed from the lake’s northern backshore, did support a small population. Fehr (1984) also described a second habitat complex for this species as an open shrubby marsh on the western side of David Lake,

also with high water in evidence. His community sample 045 described the species from very scattered *Salix* (species) and *Salix candida* in a graminoid marsh of *Carex aquatilis*, *Carex lasiocarpa* [?], *Carex utriculata*, *Carex sartwellii* (Sartwell's sedge), *Calamagrostis inexpansa*, *Scirpus acutus* (great bulrush), *Juncus balticus* and others. The third major habitat complex in the Reserve was associated with the beaver dams and shorelines of the drawndown beaver ponds, such as those at the southeastern and to the northeast ends of the Great Fen. The dams had a subhygric, sandy and organic substrate and supported an essentially mixed graminoid marsh fringe community of *Scirpus microcarpus* var. *rubrotinctus* (small-fruited bulrush), *Calamagrostis canadensis*, *Carex aquatilis*, *Carex utriculata*, *Mentha arvensis* (wild mint), *Lysimachia thyrsiflora* (tufted loosestrife), *Eleocharis palustris*, *Lysimachia ciliata*, *Sonchus uliginosus*, *Rumex occidentalis* (western dock), *Glyceria striata*, *Potentilla norvegica* (rough cinquefoil) and others. These dams appear to have been used as wildlife trails for crossing the ponds, and some degree of disturbance from the trampling may have created successional conditions here. Also associated with the pond drawdown and supporting plants of this species were shoreline marsh meadows of *Calamagrostis canadensis*, *Glyceria grandis*, *Poa palustris* (fowl blue grass), *Carex utriculata*, *Eleocharis palustris*, *Juncus nodosus*, *Alopecuris aequalis* (short-awned foxtail), *Juncus balticus*, *Catabrosa aquatica* (brook grass) and others. The final habitat that the species was discovered in was an active calcareous seepage slope with a shrubby graminoid fen, 600 m to the north of David Lake, where the plants grew at the base of the shrubs. This hygric site with flowing water had scattered *Betula occidentalis* over a marsh meadow of *Carex utriculata*, *Carex viridula*, *Carex aurea*, *Eleocharis quinqueflora*, *Solidago canadensis*, *Gentiana crinita* and several of the typical fen species.

Habitat threats in the Reserve for this species were related to the prolonged drought conditions, in particular as they affected the water levels of the pond, stream and lake shoreline habitats. The effect may be variable in the case of the stream and pond banks, where there still may have been sufficient moisture in the soil to allow the species and associated shoreline communities to expand into the wetland basin, as was the case in the stream / pond system to the northeast of the Great Fen. However, on the other hand, the drawdown conditions in other instances have not produced suitable habitat, at least at this time, as is the case in the large pond to the southeast of the Great Fen. Additionally, the use of the beaver dams as game trails may have lead to inadvertent trampling as well as incidental browsing of the plants, as was observed at one site.

Management considerations for this species should include monitoring the known populations and searching elsewhere around the periphery of the David Lake basin and the Great Fen and the other wetland shrubby marsh and thicket communities in the Ecological Reserve. The impact of prolonged drought conditions on the beaver

populations also should be examined, since the loss of the beaver dams and associated activities may change the abundance of suitable habitat for this and several other rare vascular plant species, such as the reported *Najas flexilis*, *Elodea biflora* and *Ruppia cirrhosa*.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Lycopus americanus* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type	frost (4)
Flood Hazard	not apply
Soil Drainage	imperfectly drained (5), poodly drained (6)
Perviousness	moderately (2)
Site: Macro	not apply
Site: Meso	depression (6), level (7)
Site: Micro	irregular (5), straight (1)
Site: Surface Shape	straight (1)
Ecological Moisture Regime	hygric (7), subhygric (5), subhydric (8)
Nutrients	?mesotrophic (3)
Successional Status: 1	young seral (2)
Successional Status: 2	not apply
Disturbance Factors	water (8)

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	mid- to late June to early July
Phenology: reproductive – inflorescence	early to mid-July
Phenology: reproductive – flower	early to mid- to late July, to mid- to late August
Phenology: reproductive – fruit	mid- to late July, to early to mid to late August to early September
Habitat Threats	drought drawdown of pond / stream / lake; game trails
Management Considerations	monitoring populations; drought impact on beaver populations

Veronica catenata Pennell.**—water speedwell—*SCROPHULARIACEAE***

This perennial procumbent low herb of a variety of lowland sites has a provincial Rank of **S2S3** in Alberta, and a global Rank of **G5** (Vujnovic & Gould 2002, ANHIC 2002). This is one of the three native species of *Veronica* occurring in Alberta that have somewhat open racemes which arise from the leaf axils and have strictly glabrous leaves that are more than three times as long as wide. It may be distinguished by its sessile leaves from *Veronica americana* (which has petioled leaves), and by the clasping bases of the leaves from *Veronica scutellata* (which has merely sessile leaf bases). Additionally it differs from the non-native *Veronica anagallis-aquatica*, with which it may be confused, but which previously has not been reported in Alberta, by its shorter leaves that are less than three times as long as wide, and has pedicels that are strongly ascending or upcurved (Scoggan 1979). This species includes *Veronica comosa* Richt. var. *glaberrima* (Pennell) Boivin and *Veronica salina auct. non*. However, it is not recorded under any of the above synonyms in the NatureServe data base of 2003.

It occurs across North America in virtually all the provinces and states, and is rare in Alberta and in 3 states (Kershaw *et al.* 2001). It has been mapped in Alberta from west of Calgary in the Grassland Natural Region (Kershaw *et al.* 2001), and has 21 known locations in the province (ANHIC 2003) but apparently with no records reported in the Parkland Natural Region (ANHIC 2002). The record of its occurrence in the vicinity of Wainwright Dunes Ecological Reserve was presented in the biophysical study of the reserve and its general vicinity by L. and C. Bradley (1977) that was reported in the species list in Fehr's (1984) inventory of the general area. However, no information was available for the location or number of individuals, and Fehr himself apparently did not observe the species, so it was not his community sample data. As well, this species was not repeated in the study of Cottonwood Consulting, Ltd. (1986) nor in the accumulative list in the Reserve's management plan (Anon 1998), hence its presence already may have been discounted with the authorative editing for that report. The species was not observed during the 2002 survey, hence there is no recent location information available.

The habitat of this species in the province appears to be quite diverse, including marshy, muddy or gravelly ground and shallow water by ponds and streams, and in ditches (Kershaw *et al.* 2001, Moss 1983). The reported habitat of the Bradley's in Fehr (1984) was "wet area near beaver lodge". If the species actually occurs within the Reserve's boundaries, the only beaver lodge recorded still existing was in the large pond at the southeastern side of the Great Fen area, 1.3 km northwest of David Lake, at about 52°35.660'N / 110°37.975'W. This habitat was surveyed for this species in 2002, but none was found. The drawdown conditions of the pond shoreline habitats may have both altered and eliminated some former and potential habitat sites, but also created newer

successional sites for the species.

Any habitat threats for this species would be associated with the drawdown conditions of any wetland shores where it might occur that are caused by the prolonged drought or by cessation of beaver activity. Additionally, there may be impacts from trampling or browsing by wildlife or cattle.

The first management concern for this species would be to find any vouching records for this species within the Reserve boundaries. No collection could be located by the author in the Alberta Parks and Protected Areas or University of Calgary herbaria, and the other herbaria (Alberta Provincial Museum, University of Alberta,) could not be examined for this species. Any potential occurrence of the species recorded by the author during the survey of the study area was determined to be the common *Veronica americana*. Any discoveries of records or existing populations should be resurveyed and monitored.

Hedyotis longifolia (Gaertn.) Hook.**—long-leaved bluets—*RUBIACEAE***

This low perennial herb of sandy soil in open woods, dunes and grassland habitats has a provincial Rank of **S2** in Alberta, and a global Rank of **G4G5** (Vujnovic & Gould 2002, ANHIC 2002). It has loosely tufted stems that are 10 cm to 25 cm tall, with small, linear, opposite, sessile leaves with purplish stipules. The inflorescence is terminal cymes of white, pink or light blue flowers that have four spreading lobes and a long tube and narrow sepals, and the fruit is a capsule. It also has been called *Houstonia longifolia* Gaertn. The only other member of this genus in Canada that has similar leaf and inflorescence is *Hedyotis canadensis*, an eastern species that does not enter the prairie provinces, and the other similar member in the northern United States, *Hedyotis nigricans*, does not extend further west than the Great Lakes. It bears a passing resemblance to several species of the genera *Cerastium* and *Stellaria*, but they differ in having separate petals, rather than petals joined at their base (Moss 1983, Gleason & Cronquist 1991).

The species occurs in the eastern half of North America from the southern part of western Canada to the Maritimes in five provinces, and southward in 35 states from east central United States to its east coast (NatureServe 2003). It is rare in Alberta, Saskatchewan and Quebec, and in five states, and indeed, is considered to have been extirpated from two states (NatureServe 2003, Kershaw *et al.* 2001). In Alberta it has 15 known locations from the Parkland and southern Boreal Natural Regions, with several in the vicinity of Wainwright (ANHIC 2003, Kershaw *et al.* 2001). It was reported from the Wainwright Dunes Ecological Reserve by Cottonwood Consulting, Ltd. (1986) where it was indicated on the sensitive features map as occurring in a sandland aspen grove complex 2.5 km northwest of David Lake. The area was inspected during the 2002 project, but no plants were recorded, perhaps due to the drought conditions, and no population size was indicated in the original source.

The general area where the species was reported from is an aspen successional forest and grove complex. Fehr (1984) did not have a community sample from this area, but the associated vegetation was a semiopen, low tree cover of *Populus tremuloides*, with open tall shrub cover of aspen saplings, *Salix bebbiana*, *Prunus virginiana* and *Elaeagnus commutata*, a semiclosed low shrub cover of *Rosa acicularis*, *Prunus virginiana*, *Spiraea alba* and *Juniperus communis* (common juniper), and a semiclosed herb cover of *Carex siccata*, *Oryzopsis asperifolia*, *Oryzopsis pungens*, *Galium boreale*, *Smilacina stellata*, *Thermopsis rhombifolia*, *Fragaria virginiana,* and others.

Habitat threats at this time may be the prolonged drought conditions in the habitat that may have arrested the development of the plants. Fire probably greatly affected this site in the past but recent burning signs were not evident. Grazing was not evident in this

portion of the Reserve, and the species is small enough as not to be a favoured grazing species.

Management considerations should include a mid-summer resurvey of this aspen grove for the occcurrence of this species under moister climatic conditions. The impacts of fire and continued cattle grazing management in the area should be evaluated prior to any future burns or increase in grazing pressures.

Aster pauciflorus Nutt.**—few-flowered aster—*ASTERACEAE***

This low, late-flowering herb of alkaline flats has a provincial Rank of **S2** in Alberta and global rank of **G4** (Vujnovic & Gould 2002, ANHIC 2002). This species also is known as *Almutaster pauciflorus* (Nutt.) A. & D. Love (marsh alkali aster) (NatureServe 2003). It may be differentiated from the several asters of similar habitats in the study area, notably *Aster ericoides*, *Aster borealis* (marsh aster) and *Aster brachyactis* (rayless aster), by its narrow, somewhat leathery leaves that are not auriculate and reduce in size upwards along the stem to resemble bracts, its stem which often is procumbent and is increasingly glandular into the inflorescence and flower bracts, its rather loose and unequal three-tiered involucral bracts, and its white to bluish ray flowers (Moss 1983, Scoggan 1979, Gleason & Cronquist 1991).

This species occurs in west central North America, in Canada from the Northwest Territories to Manitoba, and in the southwestern third of the United States through Wyoming and the Dakotas. It is rare in Alberta and in two of the northern states (NatureServe 2003, Kershaw *et al.* 2001). It has 28 known locations in Alberta, in the vicinity of Red Deer, Medicine Hat and Wainwright (Kershaw *et al.* 2001, ANHIC 2003), and Wallis (1990) listed it from eleven areas in his survey of saline wetlands and springs in southeastern Alberta. It was first reported by Wallis (1990) from the north side of David Lake, apparently east of the base of the peninsula, and was next located by Miejer (2001), also offshore from the base of the peninsula. An additional eight locations were discovered during the current survey within the Wainwright Dunes Ecological Reserve boundaries to the northeast and east of the David Lake peninsula as a mixture of isolated small clusters, and off the southern tip of the peninsula as a much larger population. As well, outside the Ecological Reserve boundaries along the eastern offshore of David Lake, there was a notably large population that probably extended well to the southwest along the offshore. Additionally, it is likely that there are other populations around the David Lake basin, particularly on its western side within the ecological reserve boundaries, and on the southeastern and southern sides outside the boundaries. Investigation of the calcareous spring to the north of David Lake and around the Great Fen did not reveal additional populations.

A total of 551 individual plants of this species were counted in seven localities within the boundaries of the Ecological Reserve, all along the north side of David Lake and along the eastern side of its peninsula, while outside of the Reserve 6 000 were estimated along the lake basin's eastern side, and in all likelihood, the total number of plants from around the lake's entire shore may well approach 10 000. The eight locations on the northeastern and eastern sides of the David Lake peninsula supported single to a dozen plants, and larger population off the southern tip of the peninsula had over 500 plants in a 45 m X 110

m area. In the Reserve in 2002, the species developed its inflorescence in early August, and came into flower between mid-to late August and probably to mid-September, with only a few flowers expanding on any one day. Indeed, the petals did not open until the late morning, so that any early morning observations may have overlooked the presence of these star-like flowers. It produced fruit from late August to mid- or late September.

Wallis' 1990 study of saline wetlands and springs in the Grassland and Parkland Natural Regions of Alberta recorded the species generally as being rare to locally common in springs, wet meadow outflows from springs and lake backshores. At Reflex [Old Salt] Lake to the southeast of Chauvin, east of the reserve, he recorded it as occurring "along the lakeshore of a hypersaline lake with sandy and generally saline shore", with associated species there and elsewhere including *Muhlenbergia asperifolia*, *Carex parryana* and *Gentiana aquatilis* [*i.e.*, *fremontii*], as generally is the case with its species locations here. The most notable habitat for the species was the drawdown offshore barrens of the David Lake basin with its very open, exposed alkaline sand, having over 10% cover of *Glaux maritima*, *Scirpus pungens*, *Juncus balticus*, *Muhlenbergia asperifolia*, *Potentilla anserina,* and *Agropyron trachycaulum* subsp. *trachycaulum* and subsp. *subsecundum*. This habitat supported the larger populations in the David Lake basin, and included vast populations of *Muhlenbergia asperifolia*. Also supporting smaller and more discrete locations for this species that were were the offshore meadows that extended from the high water level line for about 150 m into the David Lake basin. These tended to have a semiclosed cover consisting of the above associated species that occurred among the hummocky terrain caused by long-term cattle trampling while grazing in the offshore meadows, and probably is the habitat referred to by Meijer (2001). A less common habitat in the study area was the semiopen shrubby meadow along the northern backshore of David Lake where there may have been some groundwater seepage influence. Here the cover was low shrubs of *Salix petiolaris* and *Betula occidentalis* and a more closed herb cover of *Juncus balticus*, *Potentilla anserina*, *Carex scirpoidea*, *Agropyron trachycaulum* subsp. *subsecundum* and others.

The potential for habitat threats to the populations here must inextricably be linked to the fluctuation of the water level of David Lake, particularly since virtually all the species locations were concentrated in the currently submesic, drawdown zone between about 20 m and 100 m offshore from the former high water level line. A return to the high water levels of previous years, however welcome for the other rare species such as *Ruppia cirrhosa*, would probably greatly reduce the extent of the populations of this species and the rare *Muhlenbergia asperifolia* and *Carex parryana*. Grazing did not appear to present an immediate threat to the populations except as an incidental impact from trampling and occasional browsing. The cattle tended to gravitate to the comparatively more lushly developing *Hordeum jubatum*-dominated graminoid cover of the offshore

and did not dwell in the short and sparse meadows and barrens. It was observed, however, that grazing in the denser offshore *Juncus balticus* swards may at least locally have removed the shading of the graminoid cover and apparently 'released' the plants. Management considerations should include monitoring the current populations to ascertain how well they are surviving the drought conditions and prolonged drawdown of the alkaline lake bed. It is likely that when the drought ends and the lake level rises, the population will be greatly reduced and probably will be restricted to its currently more marginal habitats; However, undoubtedly, the rhizome, and possibly also the seed banks, will persist to take advantage of another drawdown period. The impact of grazing also could be examined, although as noted above, at this time it did not appear to be significantly detrimental.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Aster pauciflorus* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION	
Exposure Type	not apply
Flood Hazard	may be expected (3)
Soil Drainage	poorly drained (6), imperfectly drained (5), moderately well drained (4)
Perviousness	slowly (3), moderately (2)
Site: Macro	plain (7), valley floor (6)
Site: Meso	level (7), depression (6)
Site: Micro	straight (1)
Site: Surface Shape	straight (1)
Ecological Moisture Regime	hygric (7), subhygric (6)
Nutrients	?hypereutrophic (6)
Successional Status: 1	young seral (2)
Successional Status: 2	pioneer (1)
Disturbance Factors	water related (8)

ANHIC RARE NATIVE PLANT REPORT	
Phenology: vegetative	mid- to late July, early to mid-August
Phenology: reproductive	early to mid- to late August
Phenology: reproductive – flower	mid- to late August, early September
Phenology: reproductive – fruit	late August, early to late September
Habitat Threats	flooding, grazing
Management Considerations	monitoring populations, limiting access

Species location summary for *Aster pauciflorus* in the Wainwright Dunes Ecological Reserve

map site/date site	location coordinates	number (size)	habitat

plant numbers:	UTM27? 526300E 5826396N = 10 plants // UTM27? 526342E 5826482N = 8 plants
note:	none
habitat:	"wet saline and subsaline meadows round lake; higher subsaline edges and on hummocks" / 665 m
comment:	these locations are on the eastern side of the peninsula base, about 700 m NNE of peninsula's southern tip; probably 10–2–42–5W4

map/date site: **Ap3 – Astepau-020815a**

location: adjacent to Wainwright Dunes Ecological Reserve; David Lake, central eastern shore, 1.2 km ESE of peninsula's southern tip; SE/NE4–1–42–5W4; see figure and map Ap3

lat./long.: (centre) 52°34.900'N / 110°35.825'W [between A: 52°34.958'N / 110°35.753'W, B: 52°34.972N / 110°35.858'W, C: 52°34.836'N / 110°36.025'W, and D: 52°34.830'N / 110°35.986'W] [0.05'] [GPS]

collection: 020815a1 (1 replicate @ ALTA / root / rhizome / stem: procumbent, 8 – 20 cm / inflorescence: full / flower: bud 20%, preflower 65%, mature flower 15%)

photos: see also Carex parryana photos; N1 (general habitat: drawdown lake offshore, looking N) N2 (general habitat: drawdown lake offshore, looking E at backshore thicket fringe) N3 N4 (habitat detail: drawdown lake offshore ground cover, scale to ruler) N5 N17 N18 (general habitat: drawdown lake offshore, looking NE toward backshore thicket fringe, with Muhlenbergia asperifolia & Carex parryana) O19 O20 (plant detail: plant growth habit) O21 O22 O23 (plant detail: and inflorescence)

plant numbers: 6 000 plants estimated in 54 m X 300 m area; 85% in developing to mature inflorescence having 10 – 15% with mature flowers

note: associated with Muhlenbergia asperifolia and Carex parryana; occurs in a zone about 75 m offshore (to NW) from lake backshore thicket along high water level; zone is about 54 m broad and apparently does not extend further out into the drawdown basin; to the backshore side is a meadow of Hordeum jubatum – Potentilla anserina – Glaux maritima – Agropyron trachycaulum subsp. trachycaulum – Juncus balticus, and to the lakeward side is the closed lake basin meadow of Hordeum jubatum – Glaux maritima – Muhlenbergia asperifolia – Sonchus arvensis – Atriplex prostrata

habitat: David Lake drawdown basin nearshore subxeric alkaline sand supporting semiclosed to semiopen graminoid meadow of 5–20% Glaux maritima – SOIL (alkaline sand) – LITTER; 1–5% **Aster pauciflorus** – Muhlenbergia asperifolia – Juncus balticus – Carex parryana; <1% Agropyron trachycaulum subsp. subsecundum – Potentilla anserina – Hordeum jubatum – Puccinellia nuttalliana – Ranunculus cymbalaria – Aster ericoides – Agropyron trachycaulum subsp. trachycaulum – Sonchus uliginosus

map/date site: **Ap4 – Astepau-020815e**
location: Wainwright Dunes Ecological Reserve; north shore of David Lake, 1 km NE of peninsula's southern tip, about 130 m SSE to eastern boundary entrance gate; NE9–2–42–5W4; see figure and map Ap4
lat./long.: (centre) 52°35.372'N / 110°36.346'W [0.025'] [GPS]
UTM27: (centre) 12N 0527700E 5826470N [30m] [GPS]
collection: none
photo: none
plant numbers: single plant counted in 0.1 m X 0.2 m area
note: situated 3 m from nearshore meadow and 25 m from closed backshore low thicket
habitat: drawdown lake nearshore subhygric sand plain with closed shore shrubby graminoid successional meadow of LOW SHRUBS (semiopen) Salix petiolaris (10%) – Betula occidentalis (8%); HERBS (closed to semiclosed) 5–20% LITTER – Juncus balticus – Potentilla anserina – Carex scirpoidea; 1–5% Agropyron trachycaulum subsp. subsecundum – Senecio pauperculus; <1% Cirsium flodmanii – Crepis runcinata – Solidago canadensis – Equisetum arvense – **Aster pauciflorus**

map/date site: **Ap5 – Astepau-020817a-i**
location: Wainwright Dunes Ecological Reserve; N side of David Lake, 600 m NNE of peninsula's southern tip, NE10–2–42–5W4; see figure and map Ap5
lat./long.: (centre) 52°35.276'N / 110°36.718'W [0.025'] [GPS]

Shinnersoseris rostrata (A. Gray) S. Tomb**—annual skeletonweed—*ASTERACEAE***

This annual, low herb of sandy bank, dunes and loose sand habitats has a provincial Rank of **S2** in Alberta**,** and a global Rank of **G5?** (Vujnovic & Gould 2002, ANHIC 2002). *Shinneroseris rostrata* has erect, slightly branching stems, which in the Reserve grow to a height of about 25 cm. It has slightly arching and soft, linear, three-veined, sessile, glaucous leaves that are 5 cm to 20 cm long. Its inflorescence forms a relatively flat-topped, open panicle with pink ray flowers in an involucre of a cluster of very small, acuminate-ovate bracts at the base of seven to nine, 10 mm to 16 mm long, linear bracts, and it produces achenes that have a white, non-plumose pappus. This species was formerly called *Lygodesmia rostrata* A. Gray, and its nearest relative is another member of that genus, *Lygodesmia juncea* (Pursh) D. Don (skeletonweed), which invariably occurred with this species, and may be somewhat similar on first viewing (Moss 1983, Scoggan 1979). However, the *Lygodesmia juncea* differed in being a much more sprawling plant, growing as a perennial by a rhizome, with stiff, straight to only slightly arching, subulate (awl-shaped) leaves that also are glaucous but rarely attain 5 cm in length, a more diffuse inflorescence that frequently is not a well-defined panicle, with an involucre of small basal bracts that are more narrowly acute, and with only five linear larger bracts, and a sap that is notably yellow rather than white. Another provincially rare, pink-flowered, paniculate, erect plant with which it may be confused is *Stephanomeria runcinata*, which is limited to the Grassland Natural Region in the province. It differs in being a perennial, having backward-pointing teeth on the leaves, and having a distinctly plumose pappus atop the achene. As well, drought-stressed, stunted plants of the more common *Lactuca pulchella* could be mistaken for the species, but differed from these by typically having blue flowers with an even gradation in bract sizes in the involucre. In seeking these plants in their habitat, their presence also frequently was obscured due to their resemblance to the glaucous leaf colour and similar leaf projection angles and lengths of the common sand dune grass, *Calamovilfa longifolia*; so a careful examination in their potential habitat is warranted.

The species occurs in central western North America from the southern parts of the prairie provinces southward toward Texas and into Mexico. It is rare in Alberta, Saskatchewan and Manitoba, and three of the northern midwestern states (NatureServe 2003, Kershaw *et al.* 2001). In Alberta it has 11 known locations along the eastern side in the Grassland and Parkland Natural Regions of the province, with two known stations in the general vicinity of Wainwright (ANHIC 2003). It was initially recorded from the northeastern portion of the Wainwright Dunes Ecological Reserve by Cottonwood Consultants, Ltd. (1986), and was later collected by Derek Johnson in 1992; their records were repeated in the Reserve's management plan (Anon 1998). The 2002 survey of the Reserve refound at least one of the Cottonwood's general locations, and added four general clusters, all

within the Reserve's boundaries: 1.8 km west of David Lake, 1 km northwest of the lake, and 2.5 and 3 km north northwest of David Lake. The UTM grid location cited by Johnson in 1992 that appeared in the ANHIC Element Occurrence data sheet was relocated and surveyed, but no typical habitat for the species was discovered (see map Sr3).

These five clusters supported 18 sampled species locations that typically varied in size from 1.5 m X 2 m to 4 m X 35 m, and had numbers of plants ranging between 2 and 20 plants, although in one case a 2 m X 4 m area held 60 plants, and in another there were 15 plants spread over an 8 m X 75 m area. The total number of plants of this species discovered within the Ecological Reserve's boundaries was 257 individuals. The plants appeared to have been greatly affected by the prolonged drought conditions, and were producing well-developed inflorescences by mid- to late July, with successful fruit production by mid- to late August, and possibly into early or mid-September. The inflorescences of virtually all the examined plants continuously produced both flowers and fruits between at least a six to eight week period after mid-July, and in all probability each plant had the capability of producing over 50 viable seeds. Since this species is an annual, the current year's plants would disappear at the end of the season, and the limiting factor in establishing the following year's populations through seed germination may well be the presence of rainfall, as well as the deposition of the seeds on suitable sandy habitat. Nevertheless, with the 2002 growing season was markedly devoid of rainfall with only rare cloudburst downpours or very brief, transient light rains. Nevertheless, such moisture conditions apparently were sufficient for the species to have become reestablished at many of the potential sites examined during the project.

The prime habitat for this species within the Ecological Reserve was the subxeric to xeric, semiopen sand of the southwest-facing, semiactive to active erosion faces on the upper to middle slopes and draws along the sand dune ridge blowout basins. The associated community here was composed of *Calamovilfa longifolia, Stipa curtiseta, Koeleria macrantha, Carex pensylvanica* var. *digyna, Elymus canadensis (Canada wild rye), Oryzopsis hymenoides, Sporobolus cryptandra, Carex obtusata, Carex siccata, Carex praegracilis, Lygodesmia juncea, Festuca saximontana, Helianthus couplandii, Heterotheca villosa* and others, including the provincially rare *Cyperus schweinitzii* and *Chenopodium leptophyllum*. In may instances the plants occurred along the uppermost reaches of the erosion face slope, but also extended locally toward, but only barely into, the low thickets that were fringing the dune ridge crests. Here the associated species included *Prunus virginiana, Juniperus communis, Rosa acicularis, Calamovilfa longifolia, Rhus radicans* var. *rydbergii (poison ivy)* and others, as well as *Lygodesmia juncea*, which often formed a diffuse tangle that obscured the presence of the plants. In only one instance did it occur in the lower slope of a semiactive to semistable blowout basin, with an associated community dominated by *Cyperus schweinitzii*.

The main habitat threat to this species probably is the prolonged drought conditions in the region, although it appears to have been successful in surviving the drought of the past several years. Erosion and deposition from blowing sand may remove the seed bank from suitable germination sites, and in only one instance was a current population immediately in danger of being buried in actively depositing dune sand. Cattle grazing was not evident in any of the sites examined, but one dune ridge in the western portion of the reserve did have some evidence of an all terrain vehicle ("quad") using the sandy slopes for unauthorized travel.

The management considerations for this species should include monitoring the known populations in order to establish what the regeneration success might be from the previous years' seed production. Since this is an annual, but apparently with a good potential for seed production and apparently an ability to germinate readily, such monitoring would be valuable in realizing further management actions required to preserve the species. Additionally, there likely are more populations in the semiactive sand dune ridge blowout situations elsewhere within the Reserve, and further surveying probably would be fruitful. The infringement of all terrain vehicle traffic on the sand dune ridge blowouts should be actively discouraged, so as to protect this sensitive and significant habitat.

Ecological Land Survey Site Description and ANHIC Rare Native Plant Report Information for *Shinneroseris rostrata* in the Wainwright Dunes Ecological Reserve

ECOLOGICAL LAND SURVEY SITE DESCRIPTION

Exposure Type	wind (2), insulation (3)
Flood Hazard	not apply
Soil Drainage	rapidly drained (2)
Perviousness	rapidly (1)
Site: Macro	not apply
Site: Meso	upper slope (2), mid-slope (3), lower slope (4)
Site: Micro	straight (1)
Site: Surface Shape	concave (2)
Ecological Moisture Regime	very xeric (1), xeric (2)
Nutrients	?submesotrophic (2)
Successional Status: 1	pioneer (1)
Successional Status: 2	not apply
Disturbance Factors	not apply

ANHIC RARE NATIVE PLANT REPORT

Phenology: vegetative	mid-July
Phenology: reproductive – inflorescence	early to mid- to late August, early September
Phenology: reproductive – flower	early to mid- to late August, to early September
Phenology: reproductive – fruit	mid- to late August, to early to mid-September
Habitat Threats	wind erosion, grazing
Management Considerations	monitoring populations and drought impacts

Species Locations Summary for *Shinneroseris rostrata* in the Wainwright Dunes Ecological Reserve

map site/date site	location coordinates	number (size)	habitat

habitat: well drained sand dune // 685 m
comment: population not relocated in 2002; 1.6 km NNW of the David Lake peninsula's southern tip; specimen not examined

RECENTLY DISCOVERED SPECIES LOCATIONS

map/date site: Sr4 – Shinros-020715d
location: Wainwright Dunes Ecological Reserve; 3.8 km NW of the David Lake peninsula's southern tip; SW4–15–42–5W4; see figure and map Sr4
lat./long.: (centre) 52°36.614'N / 110°39.051'W [0.025'] [GPS]
collection: 020715d1 (1 replicate @ ALTA / root / stem: 12 cm / inflorescence: 8 cm / flower: bud 90%, young 10%, mature 10%, old 0%)
photo: H5 (plant detail: growth habit, note inflorescence with less than 10% open flowers) H6 H7 (flower detail: single flowers) H8 (detail habitat: sand dune blowout slope, plants in upper half of blowout habitat) H9 (general habitat: sand dune blowout slope, plants in upper half of blowout habitat, pink flags mark plants)
plant numbers: 18 plants counted in 1.5 m X 7 m area; plants extend 2/5 to 2/3 up erosion slope from base
note: associated with Cyperus schweinitzii; much Lygodesmia juncea along crest of ridge, just above the Shinneoseris rostrata population, and care taken to not confuse it with the Shinneroseris rostrata plants
habitat: sand dune ridge semiactive blowout slope (18° toward 200° to 220° – SW) with open xeric semiactive sand barrens of 50–75% SOIL (sand); 5–20% Calamovilfa longifolia; 1–5% LITTER – Stipa curtiseta; <1% Elymus canadensis – Helianthus couplandii – Carex obtusata – Cyperus schweinitzii – Salix lutea – Lygodesmia juncea – **Shinneroseris rostrata**

map/date site: Sr5 – Shinros- 020716e
location: Wainwright Dunes Ecological Reserve; 4 km NW of the David Lake peninsula's southern tip; SE8–16–42–5W; see figure and map Sr5
lat./long.: (centre) 52°36.671'N / 110°39.091'W [0.025'] [GPS]

collection: 020716e1 (1 replicate @ ALTA / root / stem: 8 cm / inflorescence: 2/3 grown, 15 cm / flower: bud 80%, young 15%, mature 15%, old 0%)

photos: G5 G6 G8 (panorama series of general habitat, flags marking population boundaries) G9 (see Cyperus schweinitzii for dune slope habitat detail) G10 G11 G12 (dune base habitat detail)

plant numbers: 17 plants counted in 1.6 m X 2.3 m area; all plants have inflorescences with 5% at midflowering stage; plants single or in groups of four

note: associated with Cyperus schweinitzii (020716d); plants at lower slope face; leaves have blue-green tone and the leaf angle of the Calamovilfa; see figure

habitat: sand dune ridge blowout slope (40° toward 170° – SSE) with very open xeric sand barrens of 50–75% LITTER – SOIL (sand); 5–20% Calamovilfa longifolia; 1–5% Cyperus schweinitzii – Carex siccata – Carex pensylvanica var. digyna; <1% Chenopodium praegracilis – **Shinneroseris rostrata** – Helianthus couplandii – Lygodesmia juncea

map/date site: Sr6 – Shinros-020716f

location: Wainwright Dunes Ecological Reserve; 4.8 km NW of the David Lake peninsula's southern tip; SW10–16–42–5W4; see figure and map Sr6
lat./long.: (SE end) 52°36.964'N / 110°39.789'W [0.025'] [GPS]

collection: none

photo: (see also photos for Cyperus schweinitzii); G12 G13 G14 G15 G16 (general habitat: panorama series (right to left), sand dune blowout basin and slope, pink flags mark upper and lower plant boundaries) G17 (habitat detail: sand dune blowout basin)

plant numbers: 6 plants counted in 4 m X 30 m area; all in inflorescence with young to submature flowers and early fruit; marked by pink ribbon on aspen

note: associated with Cyperus schweinitzii; also with dry habitat form of Carex lanuginosa (<u>not</u> C. houghtoniana); this may be the same location as that of Wallis' record for Carex houghtoniana (see Sr3 above)

habitat: sand dune ridge (7 m tall) semiactive unstable blowout slope erosion face (24° to 40° toward 240° – WSW) with xeric sand barrens of 50–75% SOIL (sand); 5–20% LITTER – Calamovilfa longifolia – Carex pensylvanica var. digyna; 1–5% Cyperus schweinitizii – Carex lanuginosa (note); <1% Koeleria macrantha – Stipa curtiseta – Carex siccata – Carex obtusata – **Shinneroseris rostrata** – Lygodesmia juncea

map/date site: **Sr7 – Shinros-020716h**

location: Wainwright Dunes Ecological Reserve; 4.9 km NW of the David Lake peninsula's southern tip; SW10–16–42–5W4; see map Sr7
lat./long.: (SE end) 52°36.970'N /110°39.795'W [0.025'] [GPS]

collection: none

photos: H14 H15 (plant detail: growth habit with inflorescence) G21 (general habitat: sand dune semiactive blowout) G22 (habitat detail: sand dune semiactive blowout, scale to ruler between 2 plants)

plant numbers: 12 plants counted in two proximate locations 30 m apart: 11 in 0.7 m X 2.5 m area and 1 in 0.1 m X 0.1 m area, all with inflorescences and about 10% midflowering; no wilting noted in spite of the extreme heat

note: associated with Cyperus schweinitzii (020716h)

habitat: 7 m tall sand dune ridge semiactive unstable blowout erosion slope crest (32° to 38° toward 200° – SSW) with very dry open to very open sand barrens of 50–75% SOIL (sand); 5–20% Carex pensylvanica var. digyna; 1–5% LITTER – Calamovilfa longifolia – Cyperus schweinitizii; <1% **Shinneroseris rostrata** – Oryzopsis hymenoides – Prunus virginiana – Lygodesmia juncea – Lithospermum incanum

map/date site: **Sr8 – Shinros-020718c**

location: Wainwright Dunes Ecological Reserve; 3.5 km N of the David Lake peninsula's southern tip; NW8–14–42–5W4; see figure and map Sr8
lat./long.: (centre) 52°36.850'N / 110°36.440'W [between 52°36.835'N / 110°36.428'W on E end and 52°36.871'N / 110°36.464'W on W end] [0.025'] [GPS]

collection: 020718c1 (1 replicate @ UAC / root / stem: 15 cm / inflorescence: 18 cm – total 25 cm/ flower: bud 90%, young 5%, mature 5%, old 0%)

photos: H20 H21 H22 (plant detail: growth habit, scale to ruler) H23 (Lygodesmia juncea, growth habit: scale to ruler, note rambling stem growth and shorter leaves) H24 H25 (plant detail: growth habit of Shinneroseris rostrata compared with Lygodesmia juncea) I15 (general habitat: dune ridge blowout, looking north, eastern plant locations marked by pink flags at centre of photo) I16 (general habitat: dune ridge blowout, western plant locations marked by pink flags, note coyote den) I17 (detail habitat: dune ridge blowout, western plant locations, scale to ruler)

plant numbers: 15 plants counted in two groups 75 m apart: E site with 10 plants in 1.5 m X 6 m area, W site with 5 plants in 2 m X 8 m area; all with inflorescences having over 25% mature flowers; plants with vigorous growth

note: aspen grove along dune ridge backslope with choke cherry adjacent

to E site and open sand with grassland to W; active coyote den at W site; marked by pink tape on choke cherry at blowout rim

habitat: sand dune ridge slope (18° to 23° toward 190 to 217° – SSW to SW) of semistable old blowout slope crest with xeric sand grassland of 50–75% SOIL (sand); 20–50% LITTER; 5–20% Carex pensylvanica var. digyna – Calamovilfa longifolia; 1–5% Koeleria macrantha – Lygodesmia juncea; <1% Carex obtusata – **Shinneroseris rostrata** – Stipa curtiseta – Helianthus couplandii – Erysimum asperum – Heterotheca villosa – Elymus canadensis – Prunus virginiana

map/date site: Sr9 – Shinros-020718e

location: Wainwright Dunes Ecological Reserve; 3.3 km N of the David Lake peninsula's southern tip; SE7–14–42–5W; see figure and map Sr9

plant numbers: 5 plants counted in 3.5 m X 5 m area; all with inflorescences with 25% mature flowers; plants somewhat small

note: plants growing among Lygodesmia juncea; recent erosion on adjacent slope face;

habitat: upper third of sand dune ridge semiactive blowout erosion slope (32° toward 160° – SSE) with open to very open xeric sand barrens of 50–75% LITTER – SOIL (sand); 1–5% Calamovilfa longifolia – Koeleria macrantha – Lygodesmia juncea – Prunus virginiana; <1% Juniperus horizontalis – **Shinneroseris rostrata** – Erysimum asperum – Helianthus couplandii – Rhus radicans var. rydbergii – Elymus canadensis

map/date site: Sr10 – Shinros-020718f

location: Wainwright Dunes Ecological Reserve; 3.3 km N of the David Lake peninsula's southern tip; NE2–14–42–5W4; see figure and map Sr10
lat./long.: (centre) 52°36.695'N / 110°36.630'W [0.025'] [GPS]

collection: none

photos: I22 (general habitat: sand dune with active blowout deposition adjacent to population, looking west, flags mark plant locations) I23 (habitat detail: sand dune with active blowout deposition adjacent to population, flags mark plant locations)

plant numbers: 13 plants counted in 3 m X 4 m area; all with inflorescences in early to

mid flowering

note: sand deposition from NW side will eventually bury or reduce site

habitat: sand dune ridge semiactive blowout slope (12° toward 165° – SSE) with semiopen xeric sand barrens of 50–75% SOIL (sand); 5–20% Koeleria macrantha – Carex pensylvanica var. digyna; 1–5% LITTER – Calamovilfa longifolia – Stipa curtiseta – Prunus virginiana; <1% Lygodesmia juncea – **Shinneroseris rostrata** – Oryzopsis hymenoides – Elymus canadensis

map/date site: Sr11 – Shinros-020718g

location: Wainwright Dunes Ecological Reserve; 3.2 km N of the David Lake peninsula's southern tip; SE2–14–42–5W4; see figure and map Sr11
lat./long.: (centre) 52°36.667'N / 110°36.604'W [0.025'] [GPS]

collection: none

photo: J0 (plant detail: growth habit with inflorescence)

plant numbers: 3 plants counted in 1 m X 20 m area; all with inflorescences in early to mid-flowering

note: marked by pink tape 30 m @ 304° to population; this to north and adjacent to above population (020718f – Sr10)

habitat: sand dune ridge uppermost slope (42° toward 210° – SSW) of semistable old blowout with semiopen to open xeric sand barrens of 50–75% SOIL (sand); 5–20% LITTER; 1–5% Calamovilfa longifolia – Stipa curtiseta – Koeleria macrantha – Lygodesmia juncea – Prunus virginiana; <1% Carex pensylvanica var. digyna – Carex obtusata – **Shinneroseris rostrata** – Chenopodium pratericola

map/date site: Sr12 – Shinros-020719f

location: Wainwright Dunes Ecological Reserve; 2 km NW of the David Lake peninsula's southern tip; NE11–3–42–5W4; see figure and map Sr12
lat./long.: (centre) 52°35.382'N / 110°38.576'W [0.025'] [GPS]

collection: 020719f1 (1 replicate @ ALTA / root / stem: 12 cm / inflorescence: 15 cm / leaf: full / flower: bud 75%, young 10%, mature 10%, old 5% / fruit: none / old stem of 2001 plant)

photos: J6 (habitat detail: sand dune blowout crest with several vigorous plants) J7 J8 (plant detail: growth habit on slope) K8 (general habitat: sand dune blowout slope, pink flags mark plant locations) K9 (general habitat: sand dune blowout slope crest, pink flags mark plant locations) K10 (general habitat: sand dune blowout basin and slope, pink flags mark plant boundary)

plant numbers: 50 plants counted in five groups in 8 m X 40 m area; all with inflorescences in late flowering to early to mid-fruiting; plants from one-

third to two-thirds up the blowout slope above the erosion face

note: associated with Cyperus schweinitzii (020719g); choke cherry thicket above blowout crest; marked by pink ribbon on birch in blowout basin 12 m @ 40° to plants; also site of Lycopodium clavatum var. monostachyon

habitat: sand dune ridge with active to semiactive blowout slope (22° toward 195° – SSW) supporting open xeric sand barrens of 50–75% SOIL (sand); 20–50% LITTER; 5–20% Calamovilfa longifolia; 1–5% Carex pensylvanica var. digyna – Lygodesmia juncea – **Shinneroseris rostrata**; <1% Helianthus couplandii – Stipa curtiseta – Carex siccata – Koeleria macrantha – Oryzopsis hymenoides – Elymus canadensis

map/date site: Sr13 – Shinros-020719g

location: Wainwright Dunes Ecological Reserve; 2 km NW of the David Lake peninsula's southern tip; NE11–3–42–5W4; see figure and map Sr13
lat./long.: (centre) 52°35.363'N / 110°38.548'W [0.025'] [GPS]

collection: none

photos: see photos of Cyperus schweinitzii (020719g): K11 (detail habitat: sand dune active blowout, scale to ruler) K12 (detail habitat: sand dune semiactive blowout, scale to ruler)

plant numbers: 5 plants counted in 1 m X 5 m area; plants have inflorescence with young to mature flowers

note: associated with Cyperus schweinitzii (020719g); marked by pink tape on low choke cherry 8 m @ 80° toward site; aspen / choke cherry grove to NW up the slope, and young successional aspen at the base of the slope

habitat: sand dune ridge slope of semiactive to semistable old blowout slope (12° to 22° toward 220° – SW) with subxeric sand grassland of 50–75% SOIL (sand) – LITTER; 5–20% Cyperus schweinitzii – Carex pensylvanica var. digyna; <1% Calamovilfa longifolia – Lygodesmia juncea – **Shinneroseris rostrata**

WAINWRIGHT DUNES ECOLOGICAL RESERVE
VASCULAR PLANT FLORA
DISCUSSION PAPER

Ian D. Macdonald
March 2003

The following compilation list of vascular plant species from the Wainwright Dunes Ecological Reserve and immediate vicinity is a based on the several reports and observation and collection notes made prior to 2002, augmented by the on-site observations and records of Ian D. Macdonald made between June and August 2002. This list is presented to consolidate the available species lists from the area; to indicate those records that are added to the existing compilations from the current project's findings; to clarify the known sources for the various records of each species; to indicate those species occurrence claims for which there are vouching specimens; and to indicate those species that present extensions from their continuous biogeographic ranges in the province; and to highlight significances of the species. Such a cumulative presentation of the known flora will assist in the preparation of a scientifically acceptable flora that will contribute to the expansion of the province's overall flora.

The several biophysical and inventory reports conducted between 1977 and 2001 served as sources for this flora: Bradley & Bradley (1977), Fehr (1984), Cottonwood Consultants, Ltd. (1986), Wallis (1990), the Reserve's management plan (1998) and Miejer (2001), as did other collection and other record sources: Johnson (1992), Cotterill (2000 2003), Alberta Natural Heritage Information Centre [ANHIC] (2002) and the author (Macdonald 2002). In all, the 506 taxa herein listed include 415 confident records and an additional 6 tentative records that have been confirmed as occurring within the current Ecological Reserve's boundaries, of which 33 are non-native species, generally of Eurasian origins. Additionally there are 31 confident records that are known to occur adjacent to the Reserve, but have not yet been confirmed from actually within it, and another 50 confident records for which there was insufficient information to confirm whether or not they occurred within or outside the Reserve's boundaries, 10 of these being non-native species. The largest families listed here are Asteraceae (62 species), Poaceae (55) and Cyperaceae (53). Of the 68 taxa listed herein, 61 appear to be new records that have been observed or collected by Macdonald in 2002 from within the Reserve, and 5 others from adjacent to the Reserve. Additionally, the occurrence of 58 taxa appear to represent extensions to their ranges, for the most part being some 50 km to 100 km from their next-nearest Grassland, Parkland and southern Boreal locations, as mapped in the *Flora of Alberta*, but in several cases being considerable extensions from their Rockies or far northern or western Parkland ranges, as for *Minuartia dawsonensis, Silene menziesii*

and *Thalictrum occidentale*. Of note are the 19 taxa that are currently listed by ANHIC as being rare in Alberta at a level of S1, S2, S2S3 or S3W (? indicates problematic determination): *Botrychium multifidum* var. *intermedium* (leather grape fern), *Najas flexilis* (slender naiad), *Ruppia cirrhosa* (widgeon-grass), *Elodea ?bifoliata* (two-leaved waterweed), *Muhlenbergia asperifolia* (scratch grass), *Carex crawei* (Crawe's sedge), *Carex ?houghtoniana* (Houghton's sedge), *Carex parryana* (Parry's sedge), *Cyperus schweinitzii* (sand nut-grass), *Eleocharis ?elliptica* (slender spike-rush), *Chenopodium ?leptospermum* (narrow-leaved goosefoot), *Drosera linearis* (slender-leaved sundew), *Gentiana fremontii* (marsh gentian), *Asclepias ovalifolia* (low milkweed), *Lycopus americanus* (American water-horehound), *Veronica ?catenata* (water speedwell), *Hedyotis longifolia* (long-leaved bluets), *Aster pauciflorus* (few-flowered aster) and *Shinneroseris rostrata* (annual skeletonweed).

The plants are presented in the Engler Prantl sequence that appears in the *Flora of Alberta* (Moss 1983); this will aid in referring to this accepted text for the province's flora and should be technically acceptable to botanists. The nomenclature conforms to that used by ANHIC; where there are recent revisions to the nomenclature that are current elsewhere, or where it differs from the original citation, the synonyms are indicated with brackets: [=]. In many cases the subspecific or varietal level appropriate to the Alberta flora is added by the author, but was not included in the original lists of the previous surveyors. Species that are not native to Alberta are indicated by an asterisk (*) following the species name, and a question mark (?) indicates some query for the occurrence record.

In the column to the far left of the species names the sources for the various occurrence claims examined during this study are indicated following the single letter codes indicated in the list below. Where there is a known vouching collection, the code letter is underlined, otherwise the records appear to be based on still credible but unvouchered observations. There may be additional pre-2002 records in reports and actual collections which could not be examined during this present project, and if overlooked, the author apologizes; hence, further modification or use of this list should also attempt to include them. Collections of apparently new additions to the list by the author have been submitted to Alberta Community Development, Parks and Protected Areas in Edmonton for deposition in their herbarium and at the University of Alberta herbarium.

In the adjacent column a series of symbols is presented to clarify the actual occurrence of the species within the present study area boundaries. In many cases the several sources cited each other but did not indicate the location of the sighting; hence, those element occurrences in the earlier, larger study area that included Ribstone Creek, Wallaby Lake and the section east of the present Ecological Reserve boundary possibly

were included in the subsequent lists. The offshore portions of David Lake adjacent to the mapped boundary line are considered to be a part of the study area. This column is intended to help clarify the presence of the species within the actual present boundaries, as follows: **C** (confident determination, confirmed occurrence within current boundaries); **B** (confident determination, confirmed occurrence adjacent to but not within current boundaries, to be sought); **~** (confident determination, but insufficient information to establish whether in or out of study area, further consideration required); and ? (tentative or questionable determination requiring substantiation or confirmation) .

The column to the right of the species names present brief comments where warranted that indicate several topics regarding the plants, as follows: **new** (whether the record is new to overall list); **ALBERTA RARE** (whether the species has provincially rarity status according to the current ANHIC lists); **range** (whether there is any range significance at regional to local levels, that is whether the occurrence here is apparently far removed from its next-nearest previously reported locations in the province according to the maps in the Flora of Alberta); and other comments on the occurrence record where appropriate. The indication of "range" also is included to help augment and reinforce the claim of that the Reserve truly represents a transition between the southern Boreal and Grassland Subregions.

VASCULAR PLANT FLORA

FERNS AND FERN ALLIES

LYCOPODIACEAE

M	C	Lycopodium clavatum subsp. monostachyon—new – range

SELAGINELLACEAE

BFCPM	C	Selaginella densa var. densa

EQUISETACEAE

BFPM	C	Equisetum arvense var. arvense
FCPM	C	Equisetum fluviatile
FM	C	Equisetum hyemale var. affine
F	B	Equisetum palustre—F at Ribstone Creek
BFbCPM	C	Equisetum pratense—range
BFCPM	C	Equisetum variegatum subsp. variegatum—range

OPHIOGLOSSACEAE

cA	C	Botrychium multifidum var. intermedium—ALBERTA RARE – range – not relocated (see text)

ASPLENIACEAE

F	~	Cystopteris fragilis

GYMNOSPERMS

CUPRESSACEAE

BFJPM	C	Juniperus communis var. depressa
BFCPM	C	Juniperus horizontalis

MONOCOTYLEDONS

TYPHACEAE

BFCPM	C	Typha latifolia

SPARGANIACEAE

M	B	Sparganium angustifolium var. angustifolium—new – adjacent to WDER
F	C	Sparganium angustifolium var. chlorocarpum [= Sparganium chlorocarpum]
FCP	B	Sparganium minimum—F – east of Ribstone Creek area
CP	C	Sparganium (species)

POTAMOGETONACEAE

FM	B	Potamogeton filiformis—E of WDER
F	B	Potamogeton friesii—not repeated in C or P lists, possibly only in Wallaby Lake?
FM?	B?	Potamogeton ?gramineus—adjacent to WDER – M a tentative sight record only
M	C	Potamogeton pectinatus [= Stuckenia pectinata]—new
F	B	Potamogeton pusillus—not repeated in C or P lists, possibly only in Wallaby Lake?
F	B	Potamogeton vaginatus—not repeated in C or P lists, possibly only in Wallaby Lake?
FCPM	C	Potamogeton zosteriformis
CPM	B	Potamogeton (species)

NAJADACEAE

FA	C	Najas flexilis—ALBERTA RARE – Fehr: not in report but has collection from WDER – M not recorded in Reserve – see text

RUPPIACEAE

FCWPA	C?	Ruppia cirrhosa [= R. maritima var. occidentalis, = R. occidentalis]—ALBERTA RARE – reported from David Lake – not mapped from here by Rare Vascular Plants of Alberta – M not recorded in Reserve – see text

ZANICHELLIACEAE

BFCWPM	C	Triglochin maritima
BFWM	C	Triglochin palustris

ALISMATACEAE

BFCPM	C	Alisma plantago-aquatica
BFCPM	C	Sagittaria cuneata

HYDROCHARITACEAE

F?	C?	Elodea ?bifoliata [= Elodea canadensis, E. longivaginata Anacharis canadensis]—Fehr: from Great Fen area – not mapped by ANHIC – possibly the ALBERTA RARE – M not recorded in Reserve – see text

POACEAE

M	B	X Agrohordeum macounii—new
BF	~	Agropyron dasystachyum var. riparium [= Elymus lanceolatus subsp. lanceolatus]
M	C	Agropyron desertorum*—new
M	C	Agropyron fragile*—new
FJPM	C	Agropyron pectiniforme* [= Agropyron cristata]
FM	C	Agropyron repens* [= Elytrigia repens var. repens]
BFWM	C	Agropyron smithii var. smithii [= Pascopyrum smithii]
F	B	Agropyron trichophorum*—F – specimen?
BFCPM	C	Agropyron trachycaulum var. trachycaulum [= Elymus trachycaulus subsp. trachycaulus
BFM	C	Agropyron trachycaulum var. subsecundum and var. glaucum [= Elymus trachycaulus subsp. subsecundus]
BFJPM	C	Agrostis scabra
FM	C	Agrostis stolonifera var. palustris(*)
BFJPM	C	Alopecurus aequalis
F	B	Avena sativa*

FCWPM	C	Scirpus pungens subsp. pungens [= Scirpus americanus]
BF?CPM	C	Scirpus validus [= Scirpus tabernaemontani]—Fehr: community data at Wallaby Lake

LEMNACEAE

BFPM	C	Lemna minor
BFM	C	Lemna trisulca

JUNCACEAE

FM	C	Juncus alpinoarticulatus
BFCWPM	C	Juncus balticus var. littoralis [= Juncus arcticus var. littoralis]
FJPM	C	Juncus bufonius
FM	C	Juncus longistylis
FWM	C	Juncus nodosus
FM	C	Juncus tenuis var. dudleyi
CP	C	Luzula multiflora [= Luzula campestris var. multiflora]—range

LILIACEAE

BFbM	C	Allium textile
FCPM	C	Disporum trachycarpum
BFCPM	C	Lilium philadelphicum var. andinum
BFCPM	C	Maianthemum canadense
BFCPM	C	Smilacina stellata [= Maianthemum stellatum]

FM	C	Smilacina trifolia [= Maianthemum trifolium]
BFCPM	C	Tofieldia glutinosa var. glutinosa
BFCWPM	C	Zigadenus elegans subsp. elegans

IRIDACEAE

BFCWPM	C	Sisyrinchium montanum var. montanum

ORCHIDACEAE

CP	~	Amerorchis rotundifolia [= Orchis rotundifolia]
F	C	Coeloglossum viride [= Habenaria viridis var. bracteata]—not listed in P
CP	~	Corallorhiza maculata
BFM	C	Corallorhiza trifida
BFCM	C	Cypripedium calceolus var. parviflorum—FC cited no variety
BFCPM	C	Platanthera dilatata var. dilatata [= Habenaria dilatata]—range
BFCWPM	C	Platanthera hyperborea [= Habenaria hyperborea]
FCPM	C	Platanthera obtusata [= Habenaria obtusata]
JPM	C	Spiranthes romanzoffiana

CHORIPETALOUS DICOTYLEDONS

SALICACEAE

BFCPM	C	Populus balsamifera var. balsamifera—BFCP cited no variety
M?	C?	Populus balsamifera var. trichocarpa—new – Macdonald record tentative
BFCPM	C	Populus tremuloides var. tremuloides
BFCPM	C	Salix bebbiana var. bebbiana
BFCWPM	C	Salix candida
FCPM	C	Salix discolor
BFbP	~	Salix exigua [= Salix interior]—P cited no source or variety
BFbM	B	Salix lutea
FCPM	C	Salix maccalliana
FCPM	C	Salix myrtillifolia var. cordata—FCP cited no variety, but probably this tall shrub
M?	C?	Salix myrtillifolia var. myrtillifolia—new? – Macdonald has tentative but likely field sighting of var. myrtillifolia, the low shrub variety from N of David Lake – collection required
BFCPM	C	Salix pedicellaris—range
BFCPM	C	Salix petiolaris

FCWPM	C	Salix planifolia subsp. planifolia
FPM	C	Salix pseudomonticola
BFb	~	Salix pyrifolia—all Macdonald's initial field determinations were Salix pseudomonticola
FCPM	C	Salix serissima

BETULACEAE

BFbCP	~	Alnus tenuifolia [= Alnus incana subsp. tenuifolia]
M	C	Betula neoalaskana—range – new
BFbCPM	C	Betula occidentalis var. occidentalis—CP cited no variety
BFCPM	C	Betula papyrifera var. papyrifera
BFCWPM	C	Betula pumila var. glandulifera—range
BFCPM	C	Corylus cornuta var. cornuta

URTICACEAE

BFCPM	C	Utrica dioica var. gracilis [= Urtica gracilis]

SANTALACEAE

BFCPM	C	Comandra umbellata var. pallida—P cited no variety

POLYGONACEAE

BFM	C	Polygonum amphibium var. stipulaceum [= Polygonum natans forma harwtrightii] (water smartweed)
JPM	C	Polygonum arenastrum* (common knotweed)
BF	C	Polygonum convolvulus*
M	C	Polygonum erectum (striate knotweed)—new
FJPM	C	Polygonum lapathifolium
BF	~	Polygonum ramosissimum
FM	C	Rumex acetosella subsp. acetosella*
FM	C	Rumex maritimus var. fueginus
BF	C	Rumex occidentalis
BFb	~	Rumex triangulivalvis [= Rumex mexicanus]
JPM	C	Rumex venosus—range

CHENOPODIACEAE

M	C	Atriplex prostrata*—new
PM	C	Axyris amaranthoides*
BFJPM	C	Chenopodium album*
M	C	Chenopodium gigantospermum—new
M?	C?	Chenopodium ?leptophyllum—ALBERTA RARE – new – problem

		determination, may be Chenopodium pratericola or C. dissectum – see text
BFM	C	Chenopodium pratericola
M	C	Chenopodium rubrum var. rubrum—new
WM	C	Chenopodium salinum
FPM	C	Monolepis nuttalliana
FCP	C	Salicornia europaea subsp. rubra [= Salicornia rubra]—F community sample 042 gives as Salicornia aristata – name not in synonyms of Kartesz (1994)
M	C	Salsola kali var. tenuifolia*—new
FCWPM?	C	Suaeda calceoliformis [= Suaeda depressa]—M? citation tentative, plants named on-site were mostly young, non-flowering Aster brachyactis plants

AMARANTHACEAE

M	C	Amaranthus blitoides*—new
M	C	Amaranthus retroflexus*—new

NYCTAGINACEAE

BFCPM	C	Mirabilis hirsuta

CARYOPHYLLACEAE

BFCPM	C	Cerastium arvense
FP	~	Cerastium nutans—range – not the provincially rare species
M	C	Cerastium vulgatum* [= Cerastium fontanum subsp. vulgare]—new
M	C	Minuartia dawsonensis—new – range extension from Rockies and northern Boreal – Great Fen
FPM	C	Moehringia lateriflora
BFbM	C	Silene drummondii var. drummondii—range
M	C	Silene menziesii var. menziesii—new – range extension
M	C	Stellaria calycantha var. calycantha—new – range
BFb	~	Stellaria crassifolia
BFM	C	Stellaria longifolia
BFPM	C	Stellaria longipes

CERATOPHYLLACEAE

FCPM	B	Ceratophyllum demersum—F – not in community data – E of WDER

RANUNCULACEAE

BFCPM	C	Actaea rubra subsp. rubra
P	~	Actaea rubra forma neglecta—P alluded to this forma, but cited no

		source
BFCPM	C	Anemone canadensis
BFPM	C	Anemone cylindrica—P cited no source
FPM	C	Anemone multifida var. multifida
M	C	Anemone multifida var. richardsiana—new
BFCPM	C	Anemone patens var. multifida
M	B	Caltha natans—new – range – E of WDER – where specimen?
Bfb	~	Caltha palustris—Fehr: indicated "may not occur in study area, found in David Lake drainage area"
BFb	~	Ranunculus abortivus
BFb	~	Ranunculus aquatilis [= Ranunculus trichophyllus]
P	~	Ranunculus cardiophyllus—P cited no source
BFCPM	C	Ranunculus circinatus [= Ranunculus subrigidus]
BFCWPM	C	Ranunculus cymbalaria var. cymbalaria
BFCPM	C	Ranunculus gmelinii var. gmelinii—BFCP cited no variety
BFb	~	Ranunculus hyperboreus [= Ranunculus natans]
BFM	C	Ranunculus macounii
BFP	~	Ranunculus rhomboideus—P provides no source
BFPM	C	Ranunculus sceleratus var. multifidus
M	C	Thalictrum occidentale var. occidentale—new – based on large vegetative specimen, appears good – range extension from Rockies and western Parklands
BFCPM	C	Thalictrum venulosum var. venulosum

FUMARIACEAE

BFbP	~	Corydalis aurea subsp. aurea

BRASSICACEAE

PM	C	Arabis divaricarpa var. divaricarpa
F	~	Arabis hirsuta—Fehr: not in community data table
BFM	C	Arabis holboelii var. retrofracta
M	B	Camelina microcarpa*—new – E of WDER
FP	C	Capsella bursa-pastoris*—P cited no source – M not record within Reserve
BFPM	C	Cardamine pensylvanica—range
BFbPM	C	Descurania pinnata var. brachycarpa
FM	C	Descurania sophia*
BFb	~	Diplotaxis muralis*
FPM	C	Draba nemorosa var. leiocarpa
BFPM	C	Erysimum asperum var. asperum

BFPM	C	Erysimum inconspicuum
BFJPM	C	Lepidium densiflorum var. densiflorum
F	C	Lepidium ramosissimum—F specimen? – his community sample 042
BFPM	C	Lesquerella arenosa var. arenosa
M	C	Rorippa palustris var. palustris—new
M?	C	Rorippa palustris var. ?hispida—new? – M has tentative variety determination
M	C	Sisymbrium altissimum*—new
FPM	C	Thlaspi arvense*

DROSERACEAE

FCWPA	C	Drosera linearis—ALBERTA RARE – not observed during survey, see text
BFCP	C	Drosera anglica—formerly ALBERTA RARE – not observed during survey, see text – any specimens?

SAXIFRAGACEAE

BFPM	C	Heucheria richardsonii var. richardsonii
FCPM	C	Mitella nuda—range

PARNASSIACEAE

BFCWPM	C	Parnassia palustris var. neogaea [= Parnassia montanensis]

GROSSULARIACEAE

BFCPM	C	Ribes americanum
BFbPM	C	Ribes hirtellum—range
F	~	Ribes hudsonianum
X	M	Ribes lacustre—new
BFCPM	C	Ribes oxyacanthoides
FM	C	Ribes triste

ROSACEAE

BFCP	~	Agrimonia striata
BFCPM	C	Amelanchier alnifolia var. alnifolia
BFCPM	C	Chamaerhodos erecta var. nuttallii
BFM	C	Crataegus rotundifolia [= Crataegus chrysocarpa]
BFM	C	Fragaria virginiana var. glauca
BFCP	C	Geum aleppicum var. strictum
M?	C?	Geum macrophyllum var. ?macrophyllum—new – range – confident sight record based on distinctive basal leaf shape – needs confirming collection

M	C	Geum macrophyllum var. perincisum—new
BFCPM	C	Geum triflorum var. triflorum
BFCWPM	C	Potentilla anserina subsp. anserina
BFM	C	Potentilla arguta
FM	C	Potentilla concinna var. concinna
BF	B	Potentilla gracilis (no variety)
M	C	Potentilla gracilis var. flabelliformis—new
BFCP	C	Potentilla hippiana var. hippiana
FJPM	C	Potentilla norvegica var. norvegica
FCPM	C	Potentilla palustris var. palustris
FJPM	C	Potentilla pensylvanica var. pensylvanica
BF	C	Potentilla rivularis—Fehr: community data table indicated in WDER at site 034
FCPM	C	Prunus pensylvanica var. pensylvanica
BFCPM	C	Prunus virginiana subsp. melanocarpa
BFCPM	C	Rosa acicularis
BF	~	Rosa arkansana—not cited in CP – range
BFCPM	C	Rosa woodsii subsp. woodsii
BFCPM	C	Rubus idaeus subsp. melanolasius [= Rubus strigosus]
BFCPM	C	Rubus pubescens
BFCPM	C	Spiraea alba var. alba

FABACEAE

BF	~	Astragalus americanus [= Astragalus frigidus var. americanus]
BFb	~	Astragalus canadensis
BFPM	C	Astragalus dasyglottis
F	~	Astragalus flexuosus—not cited in CP
BFM	C	Astragalus striatus
cM	C	Glycerrhiza lepidota var. lepidota
F	~	Hedysarum alpinum subsp. americanum
BFCPM	C	Lathyrus ochroleucus
CPM	C	Lathyrus venosus subsp. intonsus

BFCP	C	Oxytropis monticola [= Oxytropis campestris var. gracilis]
BFPM	C	Oxytropis sericea var. spicata
BFCP	C	Psoralea argophylla
BFCPM	C	Thermopsis rhombifolia

JPM	C	Trifolium hybridum
JP	B	Trifolium repens*
BFCPM	C	Vicia americana var. americana—CP cited no variety
BF	C	Vicia americana var. minor [= Vicia sparsifolia]

GERANIACEAE

FP	C	Geranium richardsonii—range

LINACEAE

BFM	C	Linum lewisii subsp. lewisii [= Linum perenne]

EUPHORBIACEAE

M	C	Chamaesyce glyptospermum [= Euphorbia glyptosperma]—new – range

CALLITRICHACEAE

M	C	Callitriche verna [= Callitriche palustris]—new

ANACARDIACEAE

BFCPM	C	Rhus radicans var. rydbergii [= Toxicodendron radicans var. rydbergii]

MALVACEAE

BM	C	Sphaeralcea coccinea var. coccinea

CISTACEAE

FCPM	C	Hudsonia tomentosa—range

VIOLACEAE

BPM	C	Viola adunca
BFPM	C	Viola canadensis var. rugulosa [= Viola rugulosa]
BFWPM	C	Viola nephrophylla
M	C?	Viola nuttallii var. major—new – Macdonald confident sight record, but requires confirming collection
M	C?	Viola renifolia—new – Macdonald confident sight record, but requires confirming collection

CACTACEAE

BFCPM	C	Opuntia fragilis—range

ELAEAGNACEAE

BFCPM	C	Elaeagnus commutata

BFPM	C	Shepherdia canadensis

ONAGRACEAE

BFM	C	Epilobium angustifolium subsp. angustifolium
BFCPM	C	Epilobium ciliatum subsp. glandulosum [= Epilobium glandulosum]
BFCPM	C	Epilobium leptophyllum—range
BFb	~	Epilobium palustre
FM	C	Gaura coccinea var. coccinea—not cited by CP
FM	C	Oenothera biennis
BFM	C	Oenothera nuttallii

HALORAGACEAE

BFCPM	C	Myriophyllum exalbescens [= Myriophyllum spicatum]

HIPPURIDACEAE

BFCPM	C	Hippuris vulgaris

ARALIACEAE

BFCPM	C	Aralia nudicaulis

APIACEAE

FPM	C	Cicuta bulbifera—range
FWJPM	C	Cicuta maculata var. angustifolia [= Cicuta douglasii]
BFM	C	Heracleum lanatum
CPM	C	Osmorhiza depauperata
BFCPM	C	Sancula marilandica
BFCPM	C	Sium suave
BFPM	C	Zizia aptera var. occidentalis

CORNACEAE

BFCPM	C	Cornus canadensis
BFCPM	C	Cornus stolonifera var. stolonifera [= Cornus sericea]

SYMPETALOUS DICOTYLEDONS

PYROLACEAE

M	C	Moneses uniflora var. uniflora—new – north of Great Fen
BJPM	C	Orthilia secunda subsp. secunda [= Pyrola secunda]
BFCPM	C	Pyrola asarifolia var. asarifolia

M	C	Pyrola chlorantha—new
BF	B	Pyrola elliptica—any BF specimen?

ERICACEAE

BFPM	C	Arctostaphylos uva-ursi

PRIMULACEAE

BFP	C	Androsace septentrionalis—P cited no source
BFCWPM	C	Dodecatheon pulchellum subsp. pulchellum [= Dodecatheon radicatum]
BFCWPM	C	Glaux maritima subsp. maritima
BFJPM	C	Lysimachia ciliata [= Steironema ciliatum]
BFCPM	C	Lysimachia thyrsiflora
BFWPM	C	Primula incana

GENTIANACEAE

FCWPM	C	Gentiana fremontii—ALBERTA RARE – large population adjacent to WDER, see text – P cited as Gentiana prostrata var. americana, a species of the Rockies
F	~	Gentiana affinis—M not record in Reserve
FWM	C	Gentianella amarella subsp. acuta
FCPM	C	Gentianella crinita subsp. macounii [= G. macounii]

MENYANTHACEAE

BFCPM	C	Menyanthes trifoliata—range

APOCYNACEAE

M	C	Apocynum androsaemifolium var. androsaemifolium—new

ASCLEPIADACEAE

BFCPAM	C	Asclepias ovalifolia—formerly ALBERTA RARE – see text

POLEMONIACEAE

JPM	C	Collomia linearis
FM	C	Phlox hoodii subsp. canescens

BORAGINACEAE

FCPM	C	Cryptantha fendlerii—range
BFb	~	Cryptantha macounii
BFM	C	Hackelia americana

FPM	C	Lappula occidentalis [= Lappula redowskii]
BFPM	C	Lithospermum incisum

LAMIACEAE

BFJP	C	Dracocephalum parviflorum [= Moldavia parviflora]
BFCPAM	C	Lycopus americanus—ALBERTA RARE – see text
BFM	C	Lycopus asper
BFCPM	C	Mentha arvensis var. glabrata
M	C	Monarda fistulosa var. menthaefolia—new
BFCPM	C	Prunella vulgaris subsp. lanceolatus—range – FCP cited no variety
FCPM	C	Scutellaria galericulata var. pubescens
BFCPM	C	Stachys palustris var. pilosa

SOLANACEAE

M	C	Solanum triflorum—new – SW corner of WDER

SCROPHULARIACEAE

BFM	C	Castilleja miniata—F is S of Wallaby Lake
F	C	Orthocarpus luteus—not cited by CP
BFCWPM	C	Pedicularis groenlandica—range
F	~	Penstemon gracilis—not cited by CP – M not record in Reserve
F	~	Penstemon procerus—M not record in Reserve
BFM	B	Veronica americana—M is E of WDER
BFb	~	Veronica catenata [= Veronica salina]—ALBERTA RARE – M not record in Reserve – see text
M	C	Veronica peregrina var. xalapensis—new
F	~	Veronica scutellata

OROBANCHACEAE

FCP	B	Orobanche fasciculata var. fasciculata

LENTIBULARIACEAE

FCP	C	Pinguicula vulgaris var. vulgaris—range
FCP	C	Utricularia intermedia—range
M	C	Utricularia minor—new – range
FCPM	C	Utricularia vulgaris subsp. macrorhiza

PLANTAGINACEAE

FPM	C	Plantago major var. major*

RUBIACEAE

BFCPM	C	Galium boreale var. intermedium
M	C	Galium labradoricum—new – range
BFJPM	C	Galium trifidum var. trifidum
BFCPM	C	Galium triflorum
CPA	C	Hedyotis longifolia [= Houstonia longifolia]—ALBERTA RARE – not seen

CAPRIFOLIACEAE

BCPM	C	Linnaea borealis var. americana
BPM	C	Lonicera dioica var. glaucescens
BFCPM	C	Symphoricarpos albus var. albus
BFCPM	C	Symphoricarpos occidentalis
BFCPM	C	Viburnum edule
BFCPM	C	Viburnum opulus subsp. trilobum [= Viburnum trilobum, = V. opulus var. americanum]—range – FCP cited no variety

CAMPANULACEAE

BFCPM	C	Campanula rotundifolia

LOBELIACEAE

BFCPM	C	Lobelia kalmii

ASTERACEAE

BFCPM	C	Achillea millefolium subsp. lanulosa—FCP cited no variety
BFWPM	C	Agoseris glauca
M	C	Ambrosia artemisiifolia var. elatior—new
BFCWPM	C	Antennaria parvifolia—FC cited as Antennaria nitida?
BFCP	B	Antennaria pulcherrima—range
F	B	Antennaria rosea
M	C	Artemisia biennis—new
BFCPM	C	Artemisia campestris subsp. caudata [= Artemisia forwardii]
M	C	Artemisia dracunculus var. dracunculus—new
BFCPM	C	Artemisia frigida var. frigida
F	B	Artemisia longifolia—not cited by CP – F: at Wallaby Lake
BFCPM	C	Artemisia ludoviciana var. ludoviciana—BFCP cited no variety
M	C	Artemisia ludoviciana var. gnaphaloides—new?
BFWJPM	C	Aster borealis [= Aster junciformis]
M	C	Aster brachyactis—new
BFCPM	C	Aster ciliolatus
BFWM	C	Aster ericoides subsp. pansus [= Aster pansus, Virgulus ericoides]
M	C	Aster hesperius var. hesperius—new

BFCWPM	C	Aster laevis var. geyeri
WmAM	C	Aster pauciflorus [= Almutaster pauciflorus]—ALBERTA RARE – in David Lake basin, see notes
BFCPM	C	Bidens cernua
FJPM	C	Cirsium arvense var. arvense*
CP	~	Cirsium drummondii—range
FWPM	C	Cirsium flodmanii
BFb	~	Cirsium foliosum—range
BFbM?	C	Cirsium undulatum—Macdonald field identification tentative
BFM	C	Cirsium vulgare*
BFWM	C	Crepis runcinata subsp. runcinata
BFJPM	C	Crepis tectorum*
M	C	Erigeron annuus subsp. septentrionalis [= Erigeron strigosus]
BFP	C	Erigeron caespitosus—P cited no source
W	~	Erigeron elatus—range – may be Erigeron lonchophyllus – any Wallis specimen?
JPM	C	Erigeron glabellus subsp. glabellus—JP cited no variety
F	C	Erigeron glabellus subsp. pubescens
M	C	Erigeron lonchophyllus—new – range
BFPM	C	Erigeron philadelphicus
FCP	~	Erigeron pumilus subsp. pumilus—CP cited no variety
BFJPM	C	Gaillardia aristata
BFbM	C	Gridelia squarrosa var. squarrosa
BFb	~	Haplopappus lanceolatus
M	C	Helenium autumnale var. montanum—new
F	~	Helianthus annuus—may actually include Helianthus couplandii
M	C	Helianthus couplandii—new? – widespread on sand dunes
F	~	Helianthus nuttallii
JPM?	C	Helianthus subrhomboideus [= Helianthus laetiflorus var. subrhomboideus]—M record tentative but probable
BFCPM	C	Heterotheca villosa var. villosa [= Chrysopsis villosa]
BFb	~	Hieracium umbellatum sensu lato [= Hieracium canadense]
BFM	C	Lactuca pulchella subsp. pulchella
BFbCWP	~	Liatris ligulistylis
BFCPM	C	Lygodesmia juncea
M	C	Matricaria matricarioides* [= Matricaria suaveolens]—new
BFCPM	C	Petasites frigidus var. palmatus [= Petasites palmatus]
BFM	C	Petasites sagittatus [= Petasites frigidus var. sagittatus]
BFbM	C	Petasites vitifolius
BFbM	C	Ratibida columnifera

BFPM	C	Senecio canus [= Packera cana]
FCPM	C	Senecio congestus
FCP	~	Senecio indecorus [= Packera indecora]—range
FPM	C	Senecio pauperculus [= Packera paupercula]
CJPAM	C	Shinneroseris rostrata [= Lygodesmia rostrata]—ALBERTA RARE – see text
BFWJPM	C	Solidago canadensis var. canadensis [= Solidago lepida, Solidago pruniosa]—P cited no variety
BFbM	C	Solidago gigantea var. serotina
M	C	Solidago graminifolia [= Euthamia graminifolia var. graminifolia]—new
BFJPM	C	Solidago missouriensis var. fasciculata—JP cited no variety
FJPM	C	Solidago nemoralis var. longipetiolata
F	C	Solidago rigida
BFM	C	Solidago spathulata var. neomexicana [= Solidago decumbens var. ereophila]
BFJPM	C	Sonchus uliginosus* [= Sonchus arvensis var. uliginosus]
FM	C	Sonchus asper*
FPM	C	Taraxacum officinale*
FP	C	Tragopogon dubius*

EXCLUDED SPECIES

BFb	~	Physaria didymocarpa—Rocky Mountain species
BFb	~	Penstemon eremophila—Rocky Mountain species
F	~	Senecio lugens—Rocky Mountain species
M?	~	Calla palustris—M field notes unclear, may be confused with Callitriche palustris
F	C	Salicornia aristata—not in the synonyms listed in Kartesz 1994

WAINWRIGHT DUNES ECOLOGICAL RESERVE
VASCULAR PLANT FLORA OF THE GREAT FEN

The following compilation list of 86 vascular plant species from the Great Fen located within the Wainwright Dunes Ecological Reserve, 1.5 to 3 km NW of David Lake, from the on-site observations and records of Ian D. Macdonald made between June and August 2002.

SHRUBS

Juniperus horizontalis, Salix candida, Salix discolor, Salix lutea, Salix maccalliana, Salix myrtillifolia var. cordata, Salix pedicellaris, Salix petiolaris, Salix planifolia subsp. planifolia, Salix pseudomonticola, Salix serissima, Betula occidentalis var. occidentalis, Betula pumila var. glandulifera, Ribes lacustre, Rosa acicularis, Viburnum edule

FERNS

Equisetum fluviatile, Equisetum variegatum subsp. variegatum

GRAMINOIDS

Typha latifolia, Triglochin maritimum, Agropyron trachycaulum var. subsecundum, Bromus ciliatus, Calamagrostis inexpansa, Muhlenbergia glomerata, Poa pratensis var. pratensis*, Sphenopholis Intermedia, Carex aquatilis var. aquatilis, Carex aurea, Carex bebbii, Carex canescens, Carex capillaris subsp. chlorostachys, Carex chordorrhiza, Carex diandra, Carex disperma , Carex gynocrates, Carex interior, Carex lanuginosa, Carex leptalea, Carex limosa, Carex prairea, Carex tenuiflora, Carex utriculata, Carex vaginata, Eriophorum gracilis, Eriophorum polystachion, Eriophorum viridi-carinatum, Juncus longistylis

FORBS

Smilacina trifolium, Tofieldia glutinosa var. glutinosa, Corallorhiza trifida, Cypripedium calceolus var. parviflorum, Habenaria dilatata, Habenaria hyperborea, Habenaria obtusata, Rumex occidentalis, Minuartia dawsonensis, Moehringia lateriflora, Silene menziesii var. menziesii, Stellaria crassifolia, Stellaria longifolia, Stellaria longipes, Cardamine pensylvanica, Drosera linearis (reported, not seen), Drosera anglica (reported, not seen), Mitella nuda, Parnassia palustris var. neogaea, Potentilla palustris var. palustris, Rubus pubescens, Viola renifolia, Epilobium angustifolium subsp. angustifolium, Epilobium leptophyllum, Aralia nudicaulis, Cornus stolonifera var. stolonifera, Orthilia secunda subsp. secunda, Pyrola asarifolia var. asarifolia, Arctostaphylos uva-ursi, Lysimachia thyrsiflora, Menyanthes trifoliata, Pedicularis groenlandica, Galium boreale var. intermedium, Galium labradoricum, Galium trifidum var. trifidum, Galium triflorum, Linnaea borealis var. americana, Lonicera dioica var.

glaucescens, Aster borealis, Solidago canadensis var. canadensis

WAINWRIGHT DUNES ECOLOGICAL RESERVE
VASCULAR PLANT FLORA OF SLOPE FEN

The following compilation list of 92 vascular plant species from the slope fen located within the Wainwright Dunes Ecological Reserve, 600m north of David Lake central north shore (SE2–11–42–5W4), from the on-site observations and records of Ian D. Macdonald made between June and August 2002.

FERNS
Equisetum arvense var. arvense, Equisetum fluviatile

SHRUBS
Populus balsamifera var. balsamifera, Salix bebbiana var. bebbiana, Salix candida, Salix discolor, Salix maccalliana, Salix myrtillifolia var. myrtillifolia, Salix petiolaris, Salix pseudomonticola, Salix serissima, Betula occidentalis var. occidentalis, Betula pumila var. glandulifera, Ribes triste, Rosa acicularis, Elaeagnus commutata, Shepherdia canadensis, Cornus stolonifera var. stolonifera, Viburnum opulus var. americanum

GRAMINOIDS
Agropyron trachycaulum var. trachycaulum, Agropyron trachycaulum var. subsecundum, Bromus ciliatus, Glyceria grandis, Glyceria striata var. stricta, Muhlenbergia glomerata, Poa palustris, Sphenopholis intermedia, Carex aquatilis var. aquatilis, Carex aurea, Carex capillaris subsp. chlorostachys, Carex diandra, Carex disperma, Carex interior, Carex leptalea, Carex prairea?, Carex utriculata, Carex viridula, Scirpus microcarpus var. rubrotinctus, Juncus alpinoarticulatus, Juncus tenuis var. dudleyi

FORBS
Lilium philadelphicum var. andinum, Smilacina stellatum, Smilacina trifolium, Zigadenus elegans subsp. elegans, Cypripedium calceolus var. parviflorum, Habenaria dilatata, Habenaria hyperborea, Habenaria obtusata, Spiranthes romanzoffiana, Anemone canadensis, Ranunculus macounii, Thalictrum occidentale var. occidentale, Thalictrum venulosum var. venulosum, Mitella nuda, Fragaria virginiana var. glauca, Geum macrophyllum var. ?macrophyllum, Rubus pubescens, Glycerrhiza lepidota var. lepidota, Vicia americana var. americana, Viola nephrophylla, Epilobium leptophyllum, Aralia nudicaulis, Cicuta maculata var. angustifolia, Osmorhiza depauperata, Sancula marilandica, Cornus canadensis, Pyrola asarifolia var. asarifolia, Pyrola chlorantha, Dodecatheon pulchellum subsp. pulchellum, Lysimachia ciliata, Lysimachia thyrsiflora, Menyanthes trifoliata, Lycopus americanus, Lycopus asper, Mentha arvensis var. glabrata, Scutellaria galericulata var. pubescens, Pedicularis groenlandica, Plantago major var. major*, Galium boreale var. intermedium, Galium trifidum var. trifidum, Galium

triflorum, Linnaea borealis var. americana, Aster borealis, Aster ciliolatus, Aster laevis var. geyeri, Crepis runcinata subsp. runcinata, Crepis tectorum*, Senecio pauperculus, Solidago canadensis var. canadensis, Sonchus uliginosus*, Taraxacum officinale*

(Additionally, Gentiana fremontii may have been reported but confirmation is required.)
